SIX UNIX CONTENDERS FOR THE XT

CHARACTER DEVICE DRIVERS

BUBBLE MEMORY BOARDS

What Would You Say To 20,000,000 Pixels?

Good-bye Redraw!

So, your CAD/CAM software is hot stuff, eh? Well think how hot it might be if you had 20,000,000 pixels of video memory to work with in your IBM PC, XT or AT.

The GraphAx 20/20 color graphics card from ACS offers you just that, and it's sensibly and flexibly organized.

ONE BOARD — ONE SLOT

Notice that we said "color/graphics card" as in singular. The 20/20 utilizes 256K memory chips in a unique physical array that requires only one of your precious expansion slots.

YOUR WINDOW ON A BIGGER WORLD

The GraphAx 20/20 utilizes a huge $2K \times 2K$ drawing area. At .01" resolution that's big enough for a drawing $20" \times 20"$! You view this drawing area through a $1K \times 1K$ viewing window* that pans and scans smoothly over the entire area . . . without redrawing!

32 COLORS OR . . .

The 20/20 is organized in five planes to give you a choice of 32 brilliant colors or . . .

You can utilize four planes (16 colors) and reserve the fifth plane for a $1/4$ resolution display of the entire $2K \times 2K$ drawing, or . . .

You might want to use the fifth plane as a "Phantom Drawing Area" where changes can be previewed before being transferred to another plane. Dynamically "drag" a drawing into position, reduce it or enlarge it, even stretch it one dimension at a time, the 20/20 lets you have it your way.

You can even use the five planes as five separate pages for fast high resolution animation.

FAST DRAW

Sooner or later even with 20,000,000 pixels in memory, you're going to have to redraw, and you don't want to have to wait all day. That's why the 20/20 is turbocharged with high speed hardware.

Let your software crank out the numbers and the NEC 7220 specialized graphics processor will crank out the graphics. Your software can elect to draw only during retrace, or ignore sync for high speed execution. How does 1.2 million pixels per second sound . . . with a burst rate of 10 million?

NOT FOR EVERYONE

The GraphAx 20/20 ultra-res graphics card is a professional tool for demanding applications in the world of CAD/CAM. Uses include engineering drawings, PC layout, architectural graphics, and a host of metering and monitoring applications. Drivers are currently being written for many of the more popular CAD/CAM

programs. To find out more, call or write:

If you can't share files on PC Network, you're using the wrong file manager.

Be connected. Btrieve™

Networks can solve problems. But running a single-user file manager can create new ones: Lost updates. Garbled data. Trashed files.

Btrieve™/N offers *safe* multi-user file management that protects your data when sharing files. And eliminates the need to rewrite your application for networking. Btrieve/N set the file management standard for the industry's most popular LANs: Netware™, Davong MultiLink™, Omninet™, PC Net™, EtherSeries™, Nestar™, and NetOne™. And now Btrieve/N sets the standard for IBM's PC Network.

Fast. Btrieve/N is fast, too. It's written in assembly language especially for the IBM®PC. And based on b-tree file indexing with automatic balancing for access speed that won't degrade as your database grows. With Btrieve/N, your applications always run fast. And users don't waste time waiting.

Automatic file recovery. Btrieve/N provides automatic file recovery after a

system crash, so accidents and power failures don't turn into database disasters. Your Btrieve data always comes back intact.

Fully-relational data management.

Using SoftCraft's entire family of products gives you a complete, fully-relational database management system. Rtrieve™/N adds report writing capabilities for generating the reports you need. Xtrieve™/N speeds users through database queries with interactive, on-screen menus—no command language or special syntax.

For professional programmers.

Btrieve/N is the fast, reliable answer for all your application development. In any development language—BASIC, Pascal, COBOL, C, FORTRAN, and APL. With multikey access to records. Unlimited records per file. Duplicate, modifiable, and segmented keys.

With Btrieve/N, you can develop better network applications. And solve problems, not create new ones.

Suggested retail prices: Btrieve, \$245; Btrieve/N, \$595; Xtrieve, \$195; Xtrieve/N, \$395; Rtrieve, \$85; Rtrieve/N, \$175. Requires PC-DOS or MS™-DOS 1.X, 2.X, or 3.X.

Scroll & Recall™

**Productivity Enhancement for the
IBM - PC, XT, AT and Compatibles**

Allows you to conveniently scroll back through data that has gone off the top of your display screen. Up to 27 pages of data can be recalled or written to a disk file (great for documenting systems operations).

Allows you to easily recall and edit your previously entered DOS commands and data lines, without re-typing.

Scroll & Recall is very easy to use, a resident utility that's always there when you need it! Fully documented. Compatible with all versions of DOS and with monochrome & graphic displays.

LOOKING FOR A BETTER FILESERVER THAN IBM PC-AT?

INTRODUCING "Core"

The world's first intelligent multi-user multi-tasking fileserver for the IBM PC, PC-XT, PC-AT and compatibles. Faster and more powerful than the AT. With features no non-intelligent disk subsystem can offer.

INTELLIGENCE An onboard 8 MHz 80186 16-bit CPU. 128K (expandable to 512K) RAM memory. An AT-compatible bus with 5 expansion cardslots.

POWER Up to 71.30 MByte formatted hard disk capacity. Fast 30 MS. voice-coil access. Cache memory. Real time multi-tasking concurrent operations. Hard disk or tape boot.

FLEXIBILITY 5 PC/AT-compatible cardslots accept all

PC-compatible networks. Like IBM, Sytek, 3Com, and others. Core's motherboard also accepts 8- or 16-bit peripherals. Like printers and modems. Making these devices accessible to all users. Optional SCSI interface is also available.

SECURITY Streaming 45/60 MByte cartridge tape backup. And thanks to our onboard CPU and operating system, no lockout of other users. Added protection through our password security system and turnkey operating panel.

RELIABILITY Less than 1 in 10^8 soft errors. Less than 1 in 10^{11} hard errors. Internal diagnostics. Error correction. Unmatched handling of media defects.

Core 45™ and Core 75™ intelligent hard disk systems. The only dedicated fileserver for your PC and compatible system. Why wait? Lancore's here now.

You know that choosing the right software is serious business. So does WATCOM.

So before you make any decisions about your software needs, talk to WATCOM—the people major software users around the world have trusted for years.

WATCOM has the products you need to get the job done right. Proven performers like WATFOR*, WATFIV*, WATBOL*, and SCRIPT. Plus new leaders in software for PC workstations and micro-to-mainframe communications. Networks, language interpreters and compilers. Text preparation and data management. All WATCOM products are human engineered to provide the optimum in people efficiency and productivity. And they're designed to run compatibly on IBM mainframes and PC's, Digital main-

frames and micros, and Commodore micros.

Whatever you need is backed up by WATCOM's innovative maintenance and support services. You'll be kept up to date with the latest in product enhancements and information. And our publications and seminars will help you get the most out of your software investment. WATCOM. Quality products. Professional service. And a reputation built on more than 150,000 licensed mainframe and micro software programs throughout the world. So talk to us before you decide. After all, choosing the right software is serious business. For you. And for WATCOM.

Make the right choice: JANET/2 NETWORK

Better resource management makes Janet/2 the right choice in software for IBM and PC Jr.* networks.

Janet/2 shares hardware, software, and data. Libraries can be centrally secured for controlled access by a number of users. Run your favorite programs under standard DOS.

Janet/2 consists of a file server connected to a maximum of 16 workstations using IBM Cluster Adapters. The file server is usually an IBM XT*. Janet/2 gives you faster logical diskettes

using a hard disk and workstation diskette drives are optional. Make the right choice. Call or write WATCOM today and we'll tell you all about Janet/2 or any of WATCOM'S other people-efficient products.

You can't pick up a PC-related magazine without seeing an editorial reference to Borland International's SIDEKICK™ program. It's one of the most popular programs ever sold to PC and PC-compatible users.

FORTUNE magazine talks about Phillip Khan's brilliantly well-executed marketing plan and a well-designed piece of software. All true. But how successful would Borland be if their product weren't absolutely rock solid?

Someone said that if your only tool is a hammer, you tend to treat all problems as if they were nails. While it's certainly possible to hammer out PC products with mere software debuggers, thousands of professionals in hundreds of companies are using Atron debugging tools.

As you can see, thirteen of the top thirty software packages were created by Atron customers. Their hammer: ATRON'S PC PROBE™, a hardware-assisted software debugging tool that plugs into your PC or compatible.

HOW THE PROS DEBUG THEIR SAND CASTLES

The PC PROBE has an umbilical that replaces your PC processor chip. Now that you can trap and catalog every signal and memory reference, you're ready to pound sand like the big boys do.

PC PROBE can trap a bug which overwrites a memory location. Because complex pointers are normally used for memory addressing, this bug occurs frequently and is quite difficult to find. As for mere software debuggers, what good is a debugger that can be wiped out by a program bug?

What better way to answer the question "How-did-I-get-here?" than to have PROBE display the real-time trace data it saved while your program was executing? Now you can do a grain-by-grain review of any sand storm.

And with the SOURCE PROBE™ upgrade to PC PROBE, you can display source-code statements* as you step through your source program. Through a window, you can continuously view critical high-level data structures. The next several source code statements are also displayed, previewing what the program is about to do.

For screen/keyboard-intensive debugging, PC PROBE's RS232 port allows screen-switching or debugging from an external CRT. For interface/hardware debugging, PC PROBE can act as a logic analyzer, trapping interrupts, I/O locations, and even signals brought in from external logic probes. All this is impossible to do with software debuggers. Which is why the pros use PC PROBE.

TODAY THE DESERT, TOMORROW THE WORLD?

Will you become king of the top-ten sand pile? Well now, history *does* have a way of repeating itself. Get your PC PROBE Federal Expressed to you today, so you can hammer on some sand, and on your competition, tomorrow.

Mainframe Strategy

IBM's recent Series/1 announcement provides some insight into future IBM strategies.

In the March and April issues of *PC Tech Journal*, I used this space to ruminate about operating environments and speculate on the future. In March I spoke of TopView and IBM. In April it was Microsoft, XENIX, MS-DOS, and Windows. This month, I was surprised by an IBM announcement that has not changed my thoughts from those previous editorials, but it has made me think about a grander IBM strategy.

The announcement was not unexpected, but the content was different than what had been anticipated. The rumor mill had been grinding one way, and IBM went in a slightly oblique direction. I was expecting IBM to announce a tiny System/36 based on a PC/AT. Instead, it announced a tiny Series/1 based on an AT (or an XT).

The System/36 product, when it comes, will be a significant one for IBM. There are almost 100,000 System/36s installed today. More important, however, is the thriving third-party software industry that the System/36 has spawned in dozens of vertical markets. IBM itself has a catalog full of applications. These vertical markets are very important to future sales of computer systems, so IBM can best serve its own interests by lowering the entry price of a family of processors. The /36, which has a good reputation for usability and user-friendliness (one IBM reseller says 80 percent of his System/36 installations are operated by the users), is IBM's best and most important multiuser system and is the smallest, reasonable IBM business computer after the PC family. It is a natural for a low-end model.

An AT/36 (my coinage) is predicted to have a mid-teens entry price, run a native copy of the System/36 operating system (SSP), and support four ASCII terminals. Rumors say the AT/36 will be 100-percent compatible. The claim about its terminal is quite interesting. System/36s usually use special System/36-specific terminals, but IBM has ap-

parently built a controller board that performs a 5251 emulation for dumb ASCII terminals. That means a user can buy Qume's new \$395 terminal, an IBM 3101, or even a regular PC running a terminal emulation program. What this really does is keep the terminal price low and lets IBM sell the system without excess baggage. IBM could also sell the small AT/36 into business offices that already own some PCs.

The AT/36 strikes me as quite an interesting product for IBM. It has a sales force ready to go—one that will understand the product before it leaves the starting gate. A ton of serious applications already exist; with little or no conversion, these applications will be quickly available. Best of all, IBM will be able to point directly at a future growth path for the entry-level customer. When the baby runs out of steam, the System/36 configurations can run the same software and operate in just the same way as the little version did. Buy an AT/36, and you will become an official, true-blue, IBM customer. And after that . . . *mainframes*.

SERIES/1

So much for priorities. I believed the rumors, got excited about the great sales story above, and IBM came along with, not a small System/36, but the *Series/1* in an AT or XT. IBM tried to become a player in the minicomputer market with the Series/1. If the PC had been marketed with the same caution and conservatism as the Series/1, we would all be using Rainbows today.

The Series/1 Processor is a dog. Any Data General or Digital Equipment Corporation mini (especially DG) at half the price can run circles around the Series/1. If you are looking for performance, don't turn to IBM for a mini.

Now to be fair, IBM has a strategy for the Series/1 that keeps it selling. First, IBM has developed extensive manufacturing software for the machine,

and it sells many manufacturing systems to a very large and important computer manufacturer: itself. Second, it has developed extensive communications hardware and software for the Series/1 and often quotes such systems as communications front-ends or concentrators for the larger mainframes, especially in transaction processing situations. This is, in fact, reasonable. Although the machine is slow, it can be expanded almost indefinitely with more expansion chassis than can be imagined. Each of those chassis can be loaded to the gills with communications boards. The machine is also incredibly reliable—a strong selling point for the communications market. Predictably, IBM has a realtime operating system kernel called Event Driven Executive (EDX) on its price list, making the Series/1 the only IBM computer to be so equipped.

My words imply that IBM has really goofed with this one. The technical assessment will have to wait for awhile, but I see an interesting strategy brewing, as well as some clues about IBM's potential to do a few magic tricks.

Let's begin with the announcement. There are two new computers, the 5170 model 495 and the 4950. No, that is not a misprint. The 495 is the AT (catch the 5170 clue?) with a Series/1 card set, and the 4950 is a *modified* XT with the set. The systems are available only as "factory-shipped units," meaning that upgrades to existing machines are impossible. Either system allows attachment of up to four "IBM 3101 display stations or their equivalent," as the IBM press release puts it. As with my imaginary AT/36, just about any ASCII terminal will probably work. The XT model comes with or without a fixed disk (it did say *modified* XT, after all).

Software announcements include Series/1 IX (UNIX System V) for the largest Series/1 (model 4956), the Transaction Processing System for medium and large Series/1s, and new ver-

sions of EDX (5) and Realtime Programming System (7 and 7.1) for the new desktop versions.

Finally, a 400KB-per-second link between the IBM PC-Network and the standard Series/1 processors (4954, 4955, and 4956) provides a gateway from a network of PCs to another PC network, a Series/1, or upward through the Series/1 to a mainframe. The connection requires a pair of channel attachment cards, cable, and software.

So what do we have? As in the AT/36 strategy I outlined above, we have a lower entry price for the Series/1 family. Furthermore, the announcement is clearly oriented toward communications, the area of the Series/1's greatest market strength. Improvements in the software for multiuser (Series/1 IX), software development (IX again), and transaction processing clarify the niche IBM seeks for the family.

On another front, IBM now has an offering that can provide file service for networks, or simply data distribution from mainframes to lots of PCs. In fact, the offering seems to support the notion of distributed processing, if anyone really knows what that means. I see a sensational sales story for all of IBM here. Now the corporate customer, IBM's bread and butter, can attach PCs to anything from anywhere using nothing but IBM equipment, but avoiding the aging 3270 communications gear and its limitations. In the meantime, the employee in accounting in Akron still can have a PC or AT or whatever on his/her desk. Better yet, perhaps that accountant can dump the 3270 and find the desktop again. After that, who knows? Maybe more *mainframe* sales to support all those PC-networks?

MAGIC TRICKS

After I finished analyzing the market position for these two new machines, I started thinking about two technical details that might be of importance to IBM in the long term.

First: IBM has built a chip-level processor in-house (as near as I can tell) for the new desktop Series/1s. It has thus made a radical departure from its normal behavior of buying processor chips outside. Even in the case of the XT/370 or AT/370, the processors were microcoded Motorola 68000 chips. IBM seems to be letting the world know it can build its own chips if it has to.

Frankly, I'm sure it can. The company might be very inclined to build its own when the instruction set involved is one of its proprietary ones. Whether

IBM can produce processor chips in volume is another question. It seems to be following the long lead of other mini manufacturers by migrating its popular instruction sets downward into smaller configurations. Both DEC and DG have already done so and are almost certainly working on miniaturizing their biggest machines. The ability of a computer manufacturer to produce a micro version of its middle processors is important for the long haul.

Second: IBM chose not to announce just a smaller version of the Series/1. Instead, it built the machine *inside* a standard PC. Sliding a secondary processor onto the bus of a PC is not a great trick, but it is important that IBM is doing so. The next step in making this trick really spectacular is learning how to build a basic system board without a personality and then adding whatever is desired. Put in a PC card, a couple of Series/1s, and a System/36 or System/370. Mix and match. Go wild. Picture an AT on a desktop in a computer room somewhere performing as two or three Series/1s and controlling communications for a particular application. Visualize a room full of equipment squished down to one tabletop in a small business. Imagine.

This is important. IBM is learning something (a lot) about building multiprocessor systems in which the proces-

sors are loosely coupled in hardware and tightly coupled in software. It will not be long before add-in processors are being handled by a PC with the ease it currently handles new driver software in an on-board ROM (for example, the fixed-disk BIOS). If there was an add-in card with a 286 coprocessor and 512KB of memory, just think of the power that would come out of a box the size of an AT with two or three more processors installed.

Let me put my feet on the ground again and get serious. There is an important message lurking in the Series/1 announcement. I've scattered clues to it above: mainframes.

IBM is in business to sell its larger computers to larger businesses. Today's small businesses are tomorrow's large businesses. Therefore, IBM needs to be sure that today's small business buys IBM and stays with IBM. To get the word out, it has been selling a very popular little box with its name on it for the past three years or so. Question: how will all the people who bought that little box start thinking mainframe? The Series/1 announcement provides the answer. They will buy their PCs, hook them together with PC-Network, and then move *mainframeward* with Series/1 communications.

Look up. There's an IBM mainframe in your future.

GETTING ANSWERS

Nothing is more gratifying to the editors of this magazine than reader response—both written and verbal. We read your letters avidly and deal with them in our letters department.

It's the phone calls that worry us. You call with exciting ideas, subscription queries, the need for more information about the material we publish, and questions about PC applications. They are engaging calls, but if we engaged in all of them we would not get the magazine out.

The calls fall into two categories: questions we cannot answer over the phone because it is necessary to have a written query to respond, and questions that we cannot answer because we don't have the information.

There are ways to get answers. Here are five of the most frequently asked questions from our readers and how to get answers to them:

Q. I would like to talk to one of your editors about writing an article.

A. All queries must be sent to us in

writing. They are passed around the office for each editor to consider.

Q. I subscribed in February but have not yet received an issue.

A. Direct all subscription inquiries to 1-800/525-0643.

Q. I remember seeing a patch to a bug in DOS. Did it appear in one of your articles?

A. We do not have the resources to help figure out the article to which you are referring. Check a standard abstracting publication for the PC; for example, *Editorial Abstracts* or *The IBM PC Index*.

Q. I started subscribing last year. Now I want to get all issues of *PC Tech Journal* from the beginning. Can you send them to me?

A. Call 1-303/447-9330 for back issues.

Q. How do I use XYZ application on my PC?

A. Consult other PC users via electronic mail or write *PC* magazine's "User to User" column.

If you don't have a Hercules Graphics Card, you could end up looking like this:

"I know, because one day it happened to me..."

"I was running some routine tests on a non-Hercules monochrome graphics card when I was struck by a severe case of *low resolutionitis*. I'm the president of Hercules and that's me exhibiting the symptoms of the disease in its advanced stages. Not a pretty sight, is it?"

"What causes *low resolutionitis*? Experts point to ordinary monochrome graphics cards with coarse, hard-to-read graphics. A bad case of eyestrain may develop if action is not taken immediately.

"Fortunately for me, a Hercules Graphics Card was nearby. A quick change brought soothing 720 x 348 graphics. That's twice the resolution of ordinary 640 x 200 graphics cards.

"Which means better graphics for Lotus™ 1-2-3™, Symphony™, Framework™, pfs:Graph®, Microsoft® Chart and Word, SuperCalc3®, AutoCad™, and dozens of other programs.

"Including Microsoft Flight Simulator, now Hercules compatible!

"Oh, and don't forget that a parallel printer port is standard on the Hercules Graphics Card, not an extra cost option.

"Now, if you're worried about buying a new product that hasn't had all the bugs

worked out, relax. Hercules has sold more monochrome graphics cards for the IBM® PC, XT™ and AT™ than anyone else in the world.

"So... you're convinced that you should buy a Hercules Graphics Card. Now, steer clear of cheap imitations. You may save a few bucks, but you won't get all of these five essential features which only Hercules has:

"1) A safety switch that helps prevent damage to your monitor, 2) the ability to keep a Hercules Color Card in your

system, 3) the ability to use the PC's BASIC to do graphics, 4) a Hercules designed chip that eliminates 30% of the parts that can go wrong, and 5) a two year warranty, because we think reliability is something you should deliver and not just talk about."

"Call 1-800-532-0600 Ext 403 for the name of the Hercules dealer nearest you and we'll rush you our free info kit.

Introducing PC software the right way to do

IBM's new Personal Decision Series. A powerful team of business programs designed for exceptional flexibility.

There's rarely one best way of doing anything.

Rather, lots of very good ways; a reality that IBM's Personal Decision Series handily accommodates.

More than any software we know of, it gives you choices. You tailor it to your

needs, instead of vice versa.

You begin with *Data Edition*, a program that not only manages huge amounts of information, but lets you take it from a surprising variety of sources: data banks, mainframes, even files created by other PC programs.

And you can retrieve your data in nearly any form you like, without a lot of headscratching. You can begin producing real work in a couple of hours.

Add *Reports+* and you can create

your own style documents, pulling facts from up to 6 *Data* files at a time, in formats you can design, for applications you can invent.

Graphs gives you a choice of 13 graph styles, with over 20 variations. And you can update old graphs without

having to make new ones.

There's also *Plans+* for financial modeling and spreadsheets, and *Words* for putting your sentences, numbers and graphs all together.

The Personal Decision Series can even take information from a number of

non-Series programs. So if you already have a favorite spreadsheet or writing program, you may still be able to use it.

You can even use files from an IBM System/36 or System/370 computer, by adding an *Attachment/36* or */370 Edition*.

All of which is perfect for people

who insist on doing things their way.

Do you know somebody like that?

. . . THE STRUCTURED PROGRAMMING TOOL!

Design your programs right on the screen using modern techniques based on the popular Jackson Structured Programming method (JSP)!

DEZIGN is more than just another flowcharting tool. It is an integrated tool for designing and documenting programs and for generating source code in any of the languages listed above!

DEZIGN enables a software developer to create Data and Program Structure Diagrams using the Sequence, Selection, and Iteration constructs; assign detailed statements to the Diagrams; and synthesize source code from the control logic represented on the Diagrams and the detailed statements assigned to them.

DEZIGN lists for \$200 and is available directly from Zeducomp, from IBM and Zenith personal computer dealers, and from software retailers.

- DEZIGN-PC runs under DOS 2.0 and 2.1.
- DEZIGN-86 runs under CP/M-86 1.1 and Concurrent CP/M-86.
- DEZIGN-16 runs under ZDOS on Zenith Z-100 computers.

"Principles of Program Design," by M. Jackson, Academic Press, describes the JSP methodology and is available directly from Zeducomp and from most professional/technical book stores.

contains 2,048 bytes) for the 30MB drive. On a 30MB disk, DOS 2.1 allocates 4,074 clusters; DOS 3.0 creates 16,279 clusters.

I find that my PC has to work 1.5 to 4 times longer doing sequential reads on this much larger number of clusters under DOS 3.0 as a result. Using the new 3.0 Norton Utility Time-mark program and the technical read-out from NORTON.COM, I studied the effects of the two types of DOS on storage, cluster size, and speed. The larger

the cluster, the faster the performance, but if the file size is small, the greater the slack or empty space in each cluster. If I format the 30MB Maynard in DOS 3.0 with its 2KB cluster size, 9.6MB of files take up 30 percent of the fixed disk's space. Loading my WordPerfect word processor takes 10 seconds. If I then reformat the same disk with DOS 2.1, with its 4KB clusters, word processor load time drops to 4 seconds. The files now occupy 13.5MB on the disk, or 42 percent of the disk space. The

CHKDSK utility is similarly affected: reading the 30MB takes 8 seconds under DOS 2.1, and 12 seconds under DOS 3.0. Setting the number of buffers higher helps, but does not remove differences between the two versions.

One has a trade-off between the efficiency of PC storage on a large fixed disk and the sequential read speed.

THE SCOPE OF DEBUGGERS

Thank you for including Periscope in your debugger digest ("Entomological Explorations," Steven Armbrust and Ted Forgeron, January 1985, p. 88). The accompanying table has two bugs.

Under the heading "Single-step past calls and interrupts," Periscope should get a "Yes;" under "Copy-protected," a "No." Periscope requires the special purpose memory board, but the disk is not copy-protected.

We are now shipping version 1.1 of Periscope. This version has many new features, such as user-controlled windows for data, register, stack, and/or disassembly information; support of Phoenix's Plink and Digital Research's LINK86 for program symbols; PC/AT support and real-mode 80286 opcodes; the ability to debug device drivers, non-DOS programs, and memory-resident programs; and system crash recovery.

Brett Salter
Data Base Decisions
Atlanta, GA

Most of the debuggers reviewed use an option on their TRACE or STEP commands to single-step past calls and interrupts. Periscope includes this feature, but implements it with a different command (JUMP), which we missed. Regarding copy protection, Periscope is protected in one sense. Although users can make as many copies as they please and can even install it onto a hard disk, the software runs only when the Periscope board is installed. This limits its use to a single machine.

—Steven Armbrust

A review of Periscope is scheduled for a future issue of PC Tech Journal.

SUPERCALC FOR THE 8087

USEFUL WORK

Just a note to tell you how much I enjoyed the February 1985 issue of *PC Tech Journal*. I really enjoyed the directory program by Ted Mirecki ("Dipping into Directories," p. 67), and found almost all of the other articles useful. PASCAL PROBLEMS

The Turbo Pascal article by Michael Covington ("The Power of Turbo Pascal," February 1985, p. 112) was much appreciated. There was a minor but disabling error in the diskspace procedure that was included; the bx register should be used to determine free space, not the dx register. The latter returns the *total* amount of space on the disk, used and not used.

It would be helpful if someone with good knowledge of the different Pascal implementations in use could provide some general guidelines, with examples, of how programs from one Pascal could be translated into others. The article by Robert Stam (Environmental Excavations," February 1985, p. 90) would be a good example. In addition, Turbo permits in-line incorporation of machine language code; an article that describes the interfacing of short machine language routines to various different Pascals would extend the usefulness of various technical articles that have appeared in publications, including *PC Tech Journal*.

Jerome Blumenthal, M.D.
Binghamton, NY

Dr. Blumenthal is exactly right about this. The correct register should be bx. I apologize for the error.

CUT WORDS

Every documentation writer should read the sidebar, "Writing Improved While You Watch," to the article, "Documentation That Works" (Michael Covington, January 1985, p. 165). Mr. Covington is right: good writers cut every unnecessary word. But Mr. Covington quit when he was just getting started.

"One of the best ways to improve your writing is to cut out unnecessary words" may be 40 percent off the original, but it has a long way to go. Why equivocate? Never say "One of the best ways..." when you can make the statement positive: "The best way..." That engages your reader. It also cuts two unnecessary words.

Putting the action first adds punch. "Cutting out unnecessary words is the best way to improve your writing." (One more unnecessary word is gone.)

What help is "out" or "your?" "Cutting unnecessary words is the best way to improve writing." (Ten words left.)

Now I am warming up. Replace "the best way to improve" with the active verb "improves." And our reader is not stupid—"unnecessary" is unneces-

DOS REDIRECTION BUG

I recently attempted to use the redirection of standard output under PC-DOS

2.0 to append text to a text file. The results were peculiar, to say the least. According to the IBM manual, '>> filename' causes 'filename' to be opened (created if necessary) and positions the write pointer at the end of the file so that all output is appended to the file. After much consternation over my failure to append to a file, I uncovered a bug in the redirection code.

The problem centers around marking the end of a file (EOF), and the subsequent locating of that mark. DOS

uses ^Z (1Ah) to mark EOF, and the first Z found in a file ends the file as far as text is concerned, although the file has the remaining bytes of the cluster (1,024 bytes DSDD) available.

By scanning the hex content of files that had been appended to by redirection, I found that the appended data were indeed there, which was indicated by the increase in the DOS reported file size, but it followed rather than preceded the existing EOF (1Ah) mark. For all practical purposes the text was hidden, though I could recover it by modifying the sector to remove the offending EOF mark.

I see no good way around this bug short of a patch from IBM. I also do not know if it exists in DOS 2.1 or 3.0. I would be interested in your reaction.

Kevin J. O'Connor
Center Valley, PA

This is indeed the case, all the way through DOS 3.0. Additionally, DOS fails to mark the end of the appended text with a new ^Z, which might cause "unexpected EOF" errors when reading the file with a processor that expects to see ^Z at EOF. To patch a file to which standard output has been appended, you must both remove the ^Z at the end of the original file and add ^Z to the end of actual text. This is plainly a bug in DOS, and if any reader has traced the problem and worked out a patch, PC Tech Journal would like to print it as a Tech Notebook.

ERRATUM

The article "Irresistible DOS 3.0" (Julie Anderson, December 1984, p. 74) incorrectly stated that once the read-only attribute is set on a file, an attempt to COPY the file would return the message "File creation error" from DOS. In fact, an attempt to COPY to the file or otherwise overwrite it returns the error message. This is not a method for copy protection as some of our readers had hoped after reading the article. We regret the misinformation.

The New Aztec C

Better Code With Less Effort

The new 3.2 Version of Manx Aztec C86-c produces faster and smaller code with less effort than any C development system available for PC-DOS and MS-DOS.

"A compiler that has many strengths ... extensions seem to be quite valuable for serious work"
(Aztec C86 2.2 review in Computer Languages 2/85)

Better Code ...

Manx Aztec C86-c produces code that executes up to 60 percent faster in up to 60 percent less space than code produced by other PC-DOS and MS-DOS compilers. In short, it generates the best code available.

An extract from the C benchmark comparison in the January, 1985 issue of Computer Languages is reproduced here. Aztec C86-c clearly generated the best code. Modifying the sieve benchmark to use register variables presents an even clearer picture. Aztec C86-c executes in 6.51 seconds, Mark Williams executes in 7.56 seconds, and there is no improvement for Lattice and Computer Innovations Optimized C86. The Dhystone benchmark results presented here are from a benchmark study conducted by MANX. The Dhystone benchmark was published in the CACM (10/84 27:10 p1013) and converted by MANX from ADA to C. The Dhystone benchmark was designed to produce a figure of merit for performance for systems software. For a full copy of the Manx Dhystone and Whetstone benchmarks including timings for large memory models call Manx.

... with Less Effort

At Manx, we understand the value of development tools, specialized features, professional documentation and technical support in making it easier for you to produce quality software. That's why we bundle more than \$1000 worth of special features and tools with Manx Aztec C86-c, provide documentation that wins consistent praise for its clarity and completeness, and provide telephone access to experienced technical support for all Manx Aztec C products.

The following are some of the more important components of the Manx Aztec C86 Software Development System. Notice that many of the features that are bundled with Manx Aztec C86-c such as the debugger, Z editor, macro assembler, library source code, and ROM support are extra cost items with other systems.

Optimized C compiler	Symbolic Debugger
AS86 Macro Assembler	C Utility Library
LN86 Overlay Linker	DOS Function Library
Z (Vi) Source Editor-c	8087/80287 Sensing Lib
ROM Support Package-c	80186/80286 Support
Graphics Library	INTEL HEX Utility-c
CP/M-86 Library-c	Librarian
Screen Library	Graphics Library
Extensive UNIX Library	Object File Utilities
Library Source Code-c	Mixed memory models-c
Microsoft/Intel Object Option	Lattice, Microsoft, and C/C86 Interface
Small and Large memory models	Unitools (MAKE, DIFF and GREP)-c

Manx offers two commercial development systems, Aztec C86-c and Aztec C86-d. Items marked -c above are provided as special features of the Aztec C86-c system. Other items are provided with both.

Third party software can often greatly improve software quality or significantly reduce software development time. Manx works with third party software developers to assure the availability of a wide variety of high quality third party software. For Aztec C, third party software is available directly from Manx. Some of the better known software products available for Aztec C86 are:

HALO	C WINDOWS	Amber Windows
PHACT	Sunscreen	PLINK86
CTREE	PANEL	FirstTime
PRE-C	Greentree	C Util Lib

Call Manx to order or for information on third party software.

... and Portable, Too!

Manx Aztec C is the most portable C development system available. Manx Aztec C is the only C development system available for all of the following: MS-DOS, PC-DOS, CP/M-86, Macintosh, CPM-80, Apple II, Radio Shack and Commodore. Manx Aztec C syntax and library routines conform as closely as possible to the letter and spirit of UNIX Version 7, System III and System V. Software created for one environment can be adapted to a host of others.

... Cross Compilation Saves Time and Resources

A comprehensive set of Cross compilers are available from Manx. Cross compilers allow development for a number of machines to be performed on a single faster host machine. Code is then downloaded and tested on the target machine. In some cases testing can also be done on the host machine. Using a PC or AT to produce and test ROM code is less expensive and more effective than specialized micro development systems.

To target development for PC-DOS, MS-DOS, CP/M-86, or ROM based 8088/8086/80186/80286 systems, Cross compilers are available from VAX/UNIX (\$2000), PDP-11/UNIX (\$1000), and the Apple Macintosh (\$750).

A wide variety of PC-DOS, MS-DOS, and CP/M-86, based cross compilers are available. The host system must be licensed for Aztec C86-c. The following targets are available for \$300 each:

Macintosh	Apple II	CP/M-80
TRS-80 III/IV	6502/6510/6511	8080/280

Call Manx for information on cross development to the 68000, 65816, Amiga, C64, C128, CP/M-68K, VRTX, and others.

For more information on XENIX, TOPVIEW and other specialized development, call Manx.

30 Day Guarantee

Any Manx Aztec C86-c or Manx Aztec C86-d development system can be returned within 30 days for a refund if it fails to meet your needs. Restrictions are that the original purchase must be directly from Manx, and shipped within the USA. Returned items must be received by Manx within 30 days. A small restocking fee may be required.

Discounts

There are special discounts available to professors, students, and consultants. A discount is also available on a "trade in" basis for users of Lattice C, C/C86, Mark Williams C, Wizard C, Digital Research C, and Microsoft C. Call Manx for details.

Aztec C Software Development Systems

To accommodate the widest possible audience of C users, Manx Aztec C is available in four configurations. Manx Aztec C86-c, Manx Aztec C86-d, Manx Aztec C86-p, and Manx Aztec C86-a.

Aztec C86-c (Commercial System) \$499

This is the best C software development system available for PC-DOS, MS-DOS, and CP/M-86. It is heavily bundled with time saving development tools and special features (see list). Initial purchase entitles the licensed user to one year of computer tracked updates. After one year, the update service can be renewed on an annual basis for a modest fee.

Aztec C86-d (Developer's System) \$299

This system includes all of the major elements of the Manx Aztec C86 Software Development System. Including Optimized C compiler, Macro Assembler, Linker, Librarian, Source Editor, and Symbolic Debugger. For price, performance, and professional features it is far superior to competing systems with list prices that are much higher. Aztec C86-d can be upgraded to Manx Aztec C86-c by paying the difference in list price plus \$10.

Aztec C86-p (Personal System) \$199

This system comes with a non-commercial license and can be upgraded.

Aztec C86-a (Apprentice System) \$99

This system is designed to assist in learning the C language.

How Become an Aztec C User

To become an Aztec C user call 1-800-221-0440 or call 1-800-832-9273 (800-TEC WARE). In NJ or outside the USA call 201-530-7997. Orders can also be telexed to 4995812.

Payment can be by check, COD, American Express, VISA, Master Card, or Net 30 to qualified customers.

Orders can also be mailed to Manx Software Systems, Box 55, Shrewsbury, NJ 07701.

There is no charge for standard domestic delivery. One day and two day express delivery is available to most areas for a minimal fee. Outside the USA standard delivery is \$20 additional and express delivery is sent freight collect. Manx takes care of export documents and the like. COD on export is available to some areas.

How To Get More Information

To get more information on Manx Aztec C and related products call 1-800-221-0440 or write to Manx Software Systems, Box 55, Shrewsbury, NJ 07701.

Distribution of Manx Aztec C

In the USA, Manx Software Systems is the sole and exclusive distributor of Aztec C. Any telephone or mail order sales other than through Manx are unauthorized. Manx Aztec C is sold at some retail outlets under license to Manx.

Does your C compiler understand you're only human?

Mark Williams knows that programmers are like everyone else: you tend to put your pants on one leg at a time.

But you still have to get your programs up and running as fast as possible. With all the buttons buttoned and all the zippers zipped.

That's why we developed the C Programming System. So you don't get caught with your pants down.

To err is human—to debug, superhuman.

Normally, nothing is more frustrating for a programmer than the debugging process. You've spent months just getting the code written, but you know it's going to take at least that much more time to get the program running right.

That's where our C Source Debugger (*csd*) can be a big help.

csd lets you debug like a human being—in C, not assembler—looking right at your code through the *csd* window, an exclusive Mark Williams feature. You can set trace-points to stop program execution at particular program lines, trace and display the value of any C expression or variable, and much more.

With *csd* you can run the target program a line at a time, continue to the next tracepoint, or even restart the whole program right in the middle of debugging. Meanwhile, you're squashing bugs as you find them. And your program will run without modification.

Get a leg up on the competition.

Every company says its compiler produces the fastest, densest code. But Mark Williams actually proves it. Take a look at the benchmark tests below and see if you don't agree.

Now imagine just how much more competitive this kind of performance could make your products.

The C Programming System supports the complete C language as defined by Kernighan & Ritchie. But it also goes on to include void and enumerated data types, register variables, structure assignments, Berkeley structure rules, and the biggest C library available. With support for a wide variety of third-party C libraries and utilities.

You also get MS-DOS compatibility, large and small memory models, 8087 in-line support, and one-step compiling. A full range of options increases your flexibility, letting you compile without linking, link without compiling, and more.

With all these advantages, it's no wonder Intel, DEC, Wang, and

many others have made MWC86 their compiler of choice. (After all, they're only human.)

A human interest story with a happy ending.

All right, you're interested—which proves you're not only human, but smart. So what do you do now?

Easy. Just call 1-800-MWC-1700. You'll talk to another human being who'll answer any questions you have. And if you want to order, we'll send you the complete system, including MWC86 compiler, *csd* debugger, complete library of functions, and more. All for just \$495.

The sooner you call, the sooner you can be winning the race to get your products out the door. Which is, after all, a very human race.

Courier 2400

U. S. Robotics' 2400-baud modem doubles throughput and enhances the Hayes standard at a terrific price.

In computing, particularly in business computing, nothing is ever done quite fast enough. Therefore, of all the ways a modem standard may be enhanced, speed remains perhaps the most important. In recent months, at least ten modem manufacturers have *announced* products that, by operating at 2400 baud (240 characters per second), effectively double the throughput of the ubiquitous 1200-baud asynchronous communications link.

However, as of this writing, only U. S. Robotics is actually delivering such a product—the Courier 2400—and at the extremely aggressive list price of \$699. Evidently, pushing 240 characters per second through the low bandwidth channel represented by a telephone line (and doing it for less than \$1,000) is not as easy as modem manufacturers had assumed. In consideration of the technological and pricing breakthrough represented by this product, *PC Tech Journal* has chosen the U. S. Robotics Courier 2400 modem as its May 1985 product of the month.

Since D. C. Hayes set the standard with its original 300-baud modem in late 1981, the field has been left wide open for other vendors to add competitive value to their modem products by implementing the Hayes standard of functionality and then building upon it. Among 1200-baud modems, the Prentice PopCom and Prometheus Pro-Modem 1200 are perhaps the most innovative products to do just that.

With the Courier 2400, speed is the revolutionary aspect; it may take a little time for the rest of the telecommunications industry to make use of it. None of the major information services used by the public currently supports 2400-baud communications.

The Courier 2400 and its later siblings will find their first use in point-to-point links now served on both ends by Hayes or Hayes-compatible modems. Many of these links span the continent;

some span oceans. Across such distances, connect time is money. On a transcontinental link that may bill hundreds of dollars a month, changing to 2400-baud modems can pay back the incremental cost of the modems over 1200-baud technology (about \$200 per modem) in a matter of *days*.

The Courier 2400 represents other evolutionary improvements to the Hayes standard. Built into the Courier's ROM code are two help screens: one details all commands available from

command mode; one explains the 16 programmable registers. The user types AT! to view the command help screen, transmitted to the screen from the modem; typing ATS! displays the register help screen. (How often have you scrambled for the manual to look up which register sets the number of rings before autoanswer?)

A much-lamented deficiency in the Hayes standard is its inability to distinguish among a dead line, a dial tone, a busy signal, or the voice of the liquor store owner whose phone number is one digit removed from MCIMail's dial-up. Like some other innovative modems (PopCom, for example), the Courier 2400 returns a distinct result code upon encountering each of these signals.

Then there are the switches. Many modems must be opened physically to change switch settings, usually by prying against plastic parts with a screwdriver, risking broken plastic and skinned knuckles. The Courier 2400 provides unencumbered access to the switches through a well in the bottom plate of the modem. Furthermore, the meaning of each switch is clearly printed on the bottom plate, along with a summary of all registers, all commands, and all LED indicators.

The Courier 2400 also has one switch that the Hayes modems do not have: the *quad* switch reverses the meaning of RS232C pins 2 and 3. Whether the Courier will be connected to DTE (data terminal equipment) or DCE (data communications equipment), the user may do so without having to resort to a "nullmodem" or "modem eliminator" cable.

The Courier 2400's volume control is a slide pot on the side, easily adjustable with one finger. The modem back plate includes a modular telephone jack for both the wall connection *and* a desk phone, saving the cost and bother of a "Y" plug for the modular outlet.

We have successfully used the Courier 2400 with Crosstalk XVI, ASCOM, Kermit, PC Talk, and several home-brew terminal programs.

The Courier 2400 resides in a pebble-finish plastic case that is certainly rugged enough, yet somehow seems a bit of a letdown. We are all very used to the wraparound aluminum extrusion in which the Hayes modem nestles, impervious to all mayhem. (It can truthfully be said that you can dance on a D. C. Hayes modem.)

You *cannot* dance on the Courier 2400. You can, however, use it to double the throughput of your communications links, at relatively little additional cost over a Hayes 1200-baud modem. That is certainly an acceptable trade-off. The Courier 2400 is a winner.

The **PC21 Indexer**, from **Compumotor Corporation**, is a complete motion controller that plugs into the PC. The PC21 allows direct control of the manufacturer's microstepping motor/drives and may also be used to operate DC servo amplifiers with full closed loop control. The indexer accepts high-level commands from the PC at its own address on the PC bus, permitting use of multiple indexer cards in the PC or expansion chassis. Simple motion commands will accelerate or decelerate the motor/drive and simultaneously maintain positive control of move distance. A list of as many as 300 commands may be assembled and stored in the PC21 Indexer. Price: \$795.

The 51C259 will be offered in two versions: the 51C259H, which takes advantage of the high-bandwidth benefits of CHMOS, and the 51C259L, which emphasizes the low-power requirements. The CMOS 256K DRAMs are especially in demand for low-power uses,

such as portable computers, and high-bandwidth memory applications, such as graphics and digital signal processing. For quantities of 1,000 or more, prices range from \$28.75 to \$48.65 each, depending on performance characteristics; expected price for the 51C259H-20 is \$18 each for 10,000 (available in the fourth quarter of 1985).

Interphase Corporation's Maverick SMD PC-80 is a high-performance disk drive controller, available alone or integrated into a disk subsystem for the PC and compatibles. Now it provides the PC/AT access to SMD (storage module device) drives. These drives offer as much as five times the speed of a PC/XT that is equipped with a Winchester hard disk. Interphase offers the Maverick controller as part of its RDS 350 and RDS 375 removable disk 50 and 75MB SMD drive subsystems, and with its fixed-disk 590MB drive subsystem, the FDS-590. Because the SMD PC-80 resides on a single board, it occupies only one card slot in the computer's chassis. \$1,295.

National Instruments has announced new hardware and software products for the PC family and compatibles. Further, the **GPIB-PC2A** and **Revision C** software are completely compatible with the IBM General Purpose Interface Bus Adapter. This interface from National Instruments is the most recent in its family of GPIB interfaces. These interfaces allow computers to control 4,000 IEEE-488 programmable instruments available from more than 500 vendors for engineering, scientific, CAD/CAM, and medical applications.

The GPIB-PC2A interface is a half-height board that complies with all of the IBM expansion slot specifications, enabling it to fit into any available slot, including the short slots in the IBM Portable PC. Like its predecessors, the new board is based upon the NEC uPD7210 GPIB controller chip and a programmable logic array providing the most complete set of GPIB functions in the hardware with a minimum number of circuit elements. The new Revision C software package is designed to run on the GPIB-PC2A, as well as the IBM GPIB Adapter. A unique feature of the Revision C software is that it will automatically configure itself to run on a variety of compatible systems. Prices: GPIB-PC2A, \$385; equivalent kit with realtime clock, \$485; Revision C software kit, \$75; language interfaces, \$50 each.

The **TIAC Network Processing System (NPS)** is a hardware/software system designed to operate independently of or in conjunction with a PC while providing a smart network interface. The NPS consists of a base processor (PC-424) and four optional submodules: bus extender, a LAN generic interface, video graphics and keyboard interface, and four-serial-channel interface. The

network I/O coprocessor is a max mode 8088-based, plug-in adapter that takes up one PC expansion slot. The **PC-424** is designed to relieve the host processor of all higher level protocol processing responsibilities associated with multiple serial lines, networking, and cipher operations. Four serial channels are provided on board. The PC communicates with the PC-424 via a high-speed DMA-controlled FIFO (thus allowing arbitrarily large message sizes). With the addition of a video graphics and keyboard interface module, both of which are compatible with the PC, the PC-424 becomes a stand-alone PC. Optional plug-on adapter modules expand the basic functionality of the PC-424. \$845.

SOFTWARE

The **BYSO SOFT WINCHESTER** program, by the **Levien Instrument Company**, is an inexpensive software alternative to a hard disk. Once loaded on a system disk, it is transparent. The program stores the most frequently used data in RAM memory, where it can be accessed quickly, and loads many programs faster than from a hard disk. Its large storage capacity allows the use of 1,440KB of data; if data are needed that cannot be accessed from the RAM or disk, the program will ask for the disk with the data to be inserted. **SOFT WINCHESTER** provides protection for data: it automatically backs up all data to floppy disk. It is also removable—just press a key combination and use new sets of 1,440KB of data (four floppy disks). \$60.

TURBO 3.0 TURBO 2.0 MS PASCAL

The best just got better: Introducing Turbo Pascal 3.0

We just added a whole range of exciting new features to Turbo Pascal:

- First, the world's fastest Pascal compiler just got faster. Turbo Pascal 3.0 (16 bit version) compiles twice as fast as Turbo Pascal 2.0! No kidding.
- Then, we totally rewrote the file I/O system, and we also now support I/O redirection.
- For the IBM PC versions, we've even added "turtle graphics" and full tree directory support.
- For all 16 Bit versions, we now offer two additional options: 8087 math coprocessor support for intensive calculations and Binary Coded Decimals (BCD) for business applications.
- And much much more.

The Critics' Choice.

Jeff Duntemann, PC Magazine: "Language deal of the century . . . Turbo Pascal: It introduces a new programming environment and runs like magic."

Dave Garland, Popular Computing: "Most Pascal compilers barely fit on a disk, but Turbo Pascal packs an editor, compiler, linker, and run-time library into just 39K bytes of random-access memory."

Jerry Pournelle, BYTE: "What I think the computer industry is headed for: well documented, standard, plenty of good features, and a reasonable price."

Portability.

Turbo Pascal is available today for most computers running PC DOS, MS DOS, CP/M 80 or CP/M 86. A XENIX version of Turbo Pascal will soon be announced, and before the end of the year, Turbo Pascal will be running on most 68000 based microcomputers.

(*) Benchmark run on an IBM PC using MS Pascal version 3.2 and the DOS linker version 2.6. The 179 line program used is the "Gauss-Seidel" program out of Alan R. Miller's book: *Pascal programs for scientists and engineers* (Sybex, page 128) with a 3 dimensional non-singular matrix and a relaxation coefficient of 1.0.

An Offer You Can't Refuse.

Until June 1st, 1985, you can get Turbo Pascal 3.0 for only \$69.95. Turbo Pascal 3.0, equipped with either the BCD or 8087 options, is available for an additional \$39.95 or Turbo Pascal 3.0 with both options for only \$124.95. As a matter of fact, if you own a 16-Bit computer and are serious about programming, you might as well get both options right away and save almost \$25.

Update policy.

As always, our first commitment is to our customers. You built Borland and we will always honor your support.

So, to make your upgrade to the exciting new version of Turbo Pascal 3.0 easy, we will accept your original Turbo Pascal disk (in a bend-proof container) for a trade-in credit of \$39.95 and your Turbo87 original disk for \$59.95. This trade-in credit may only be applied toward the purchase of Turbo Pascal 3.0 and its additional BCD and 8087 options (trade-in offer is only valid directly through Borland and until June 1st, 1985).

Total ProKey compatibility. Every Prokey Macro file may be used by SuperKey *without change* so that you may capitalize on all the precious time you've invested.

Now your PC can keep a secret! SuperKey includes a resident file encryption system that uses your password to encrypt and decrypt files, even while running other programs. Two different encryption modes are offered:

1. Direct overwrite encryption (which leaves the file size unchanged) for complete protection. At no point is a second file that could be reconstructed by an intruder generated. Without your secret password, no one will ever be able to type out your confidential letters again!

2. COM or EXE file encryption which allows you to encrypt a binary file into an ASCII file, transmit it through a phone line as a text file and turn it back again into an executable file on the target machine (only of course if your correspondent knows the secret password!). Now, you will even be able to secretly exchange programs through Public Bulletin Board Systems or services such as CompuServe.

Totally memory resident at all times, gives SuperKey the ability to create, edit, save and even recall new or existing macro files anytime, even while running another program.

Pull down macro editor. Finally, a sensible way to create, edit, change and alter existing macro definitions. Even while using another application, a simple keystroke instantly opens a wordprocessor-like window where you're allowed to see, edit, delete, save and even attach names to an individual macro or file of macros, and much more.

Sorry ProKey !

Superb software at reasonable prices!

There is much more to SuperKey. Maybe the best reason to buy SuperKey is that it is a Borland International Product. Each one of our products is the best in its category. We only believe in absolutely superb software at reasonable prices!

An offer you can't refuse.

Whether you are a ProKey user or you've never used a keyboard enhancer before, your boat has come in. You can get your copy of SuperKey at this irresistible price.

Users can define, edit, save, load, and recall macros in realtime. **SuperKey's** resident full-screen macro editor can be "pulled down" on top of the main program; it allows manipulation of macro files in a manner transparent to the main program. The command stack has a capability to recall automatically the last 20 entered commands; the user can select one or more commands to be edited and reused, even at the DOS command level. Two modes of data encryption are supported: direct-overwrite protection and textfile mode, which enables users to encrypt binary files. Price: \$69.95.

A new utility program for the PC called **PC-USAGE** has been released by **Stilwell Software Products**. The 1985 tax laws require computer users to record their usage of the computer if they want to deduct any business portion of the computer on their taxes. **PC-USAGE** can help users meet this requirement. The program is started at the beginning of each session with the computer in one of two ways: if an **AUTOEXEC.BAT** file is used, **PC-USAGE** can be included in that file; otherwise, the user just types the word *usage* when the computer is started up. Once started, the program automatically retrieves the system date and time. It also checks to see if the record of the last session had an end time, if not, the user is given the opportunity to fill it in; it includes a remark area as well. The program also records whether the session is business-related or personal. On request, **PC-USAGE** provides the user with a report that lists all usage of the computer as well as the total time of computer usage and the present business usage and personal usage. \$24.95. *Stilwell Software Products, 16403 N. 43rd Drive, Glendale, AZ 85306; 602/978-4678*

Relational Database Systems, Inc. has called for standardizing on IBM's SQL (standard query language) for all database programming and, in support of such a call, has announced that it will share some of its own source code with systems developers. In conjunction with the announcement, RDS has unveiled two new products embodying SQL: **Informix-SQL** and **Informix-ESQL/C**. The company feels that without standardization, "billions of dollars will be wasted by business and government and other computer users, because database expertise will be fragmented over many different database languages, when only one is needed."

Informix-SQL is a new database applications development product derived from RDS's flagship product, **Informix**. The new product runs on a wide range of UNIX-based micros, minis, and mainframes; it provides high-level tools to define and use custom data entry and query screens, as well as custom reports. A PC-DOS version will be available shortly. **Informix-ESQL/C** provides SQL query statements to access databases from C programs. Each is available in either a full-development version or separately as a run-only version to be embedded in vertical (canned) applications. Both products will be distributed through RDS's OEMs, VARs, and distribution network. Prices: **Informix-SQL**, \$1600; **Informix-ESQL/C**, \$1,200. *Relational Database Systems, Inc., 2471 E. All in all, WordPerfect is absolutely stunning.

PC Magazine

In the beginning, the creators of WordPerfect set out to design the perfect word processing software for business. Along the way, they tested each new function on the very secretaries who would eventually be using it. Thanks to them, the product lives up to its name: WordPerfect.

Easy.

Learning WordPerfect's basic text editing functions is quick and simple. Plus, comprehensive documentation and simple practice exercises help even beginners master WordPerfect's many other functions easily.

PC World

Fast.

With WordPerfect's document orientation, you never have to wait between pages of text. No matter how fast you type, WordPerfect won't slow you down.

Complete.

In addition to standard word processing functions, WordPerfect includes many extra business features, such as a 100,000-word phonetic dictionary; table and index generation; multi-page footnoting; automatic outlining and paragraph numbering; and a network version.

PIK'r by Samkhya

STATA by CRC

Samkhya Software Corporation has announced the availability of its first productivity tool for bridging the communications gap between incompatible software programs on the PC and compatibles. The new product, **PIK'r**, is a full-screen data editor that allows users to choose the data they want to use from any report and easily reformat the data for transfer between database management software, spreadsheets, and word processors. The program also allows ASCII files generated by mainframe programs to be formatted for use by PC applications; it features a state-of-the-art "human" interface and supports a mouse. The PIK'r screen-oriented editing features let any PC user scroll easily through long reports, choose the data required, and then transfer the data to the format that is required. \$95.

STATA by **Computer Resource Center** is a program that helps users manage, display, and analyze data. It has features in common with spreadsheet programs, database management programs, statistical packages, and programming languages. STATA is interactive, making it possible to answer the "what if" questions that spreadsheets handle so well, without rigid restrictions on the organization of data. It allows the user to create complex data sets, transform them in almost any way desired, and locate particular pieces of information. STATA performs a variety of statistical analyses, including multivariate regression; and, like a programming language, it allows the user to store groups of STATA commands so that complicated analyses can be automated. \$395.

Softway, Inc. has introduced **MATIS**, an applications development tool that allows programmers to design sophisticated screens and incorporate them into their programs. MATIS is a collection of assembly language subroutines providing the ability to design data entry/display screens of almost unlimited size, to create windows for single- or multiple-screen display, and to manage the created screens when the application is run. Screens are referenced by names; they may be saved on disk and even printed directly. MATIS runs on the PC, PC/XT, and true compatibles with DOS and 128KB of RAM. It is interfaced with most popular languages, including interpreted and compiled BASIC, Pascal, C, and assembly language. \$150.

Microsoft COBOL version 2.0 has been released by **Microsoft Corporation**. This new version has been tested and certified by the U.S. Government's General Services Administration Federal Software Testing Center at the high level of compliance with the ANSI 74 level 2 standard. New features of Microsoft COBOL include multikey ISAM (indexed sequential access method), dynamic call and cancel, and built-in sort/merge. Version 2.0 brings capabilities previously found only in mainframe versions of COBOL to microcomputers that use MS-DOS, thus making it possible for mi-

cro to be used in the development of COBOL applications for mainframes and for mainframe COBOL applications to be moved to micros. \$700.

RTCS/Real-Time Computer Science Corporation has announced several new products. With the first, RTCS has configured Intel's iRMX86 operating system to IBM device driver specifications to offer a realtime multitasking operating system: **PC/RTX** includes facilities for executing programs concurrently, sharing resources and information, servicing asynchronous events, and interactively controlling system resources and utilities. Price: \$1,000.

Version 5.0 of the **RTCS/UDI** has been released; it is an implementation of Intel's Universal Development Interface, which allows software developers to run Intel programming languages and utilities on the PC and PC/XT, and now the PC/AT. Version 5.0 enhances previous versions making the software 100-percent compatible with Intel's 16-bit software products. \$500.

Another product allows software developers utilizing Intel's 8-bit software to run Intel programming languages on the PC or PC/XT. Unlike other 8-bit operating systems that are on the market, no additional hardware is required to run **iSIM85**, leaving valuable expansion slots free. \$500.

BIT FOR BIT THE BEST MODEM ON THE MARKET.

Other people make modems for telecommunications. But our new Courier 2400™ modem is made for business. This modern modem transmits, over the phone, 240 characters a second, enabling you to upload or download data at twice the speed of a 1200 bps modem. You'll cut phone costs, save precious hours and increase productivity.

BEING FASTER IS IMPORTANT. BUT BEING BETTER WAS OUR GOAL.

The Courier 2400 features auto-dial and auto-answer ...and is fully CCITT and Bell compatible. It responds to the full AT command set, allowing you to use any of the popular telecom software packages, including Telpac™ by U.S. Robotics, Crosstalk™, PC Talk™, Smartcom™ and many others. And the entire AT command set and S-register functions are displayed on "help screens" and again summarized for you on the underside of the unit.

Help Screens

It lets you know the length of each call, tells you (on screen) the status of a call in progress, and even features an adjustable speaker to provide audio phone

Courier 2400 is accommodating in other ways too.

Microlink 2400™

line monitoring. Courier can test itself in both answer and originate modes, and automatically adjusts from 2400 bps to 1200 or 300 bps. And a powerful automatic equalizer assures nearly perfect performance on every call.

BEST OF ALL, COURIER IS COMPATIBLE WITH YOUR BUDGET.

At \$699, you'll not find more modem for the money. If you prefer an internal slot modem for IBM-PC and compatible computers, our new Microlink 2400™ will deliver the same superior performance at the same affordable price. And to get the most out of either Courier or Microlink, ask for new, improved Telpac telecommunications software with easy to use windows.

Bottom of Courier

We set out to build the best modem on the market. Now, it's ready. Once you try Courier or Microlink, we think you'll agree — we're not exaggerating one bit.

Rev Up the AT Keyboard

The PC/AT's flexible hardware allows the user to speed up key response.

Does it sometimes seem to take forever to move the cursor in a text editor or word processor? This is usually not the fault of the software. The real culprit is the keyboard hardware that controls the repeat speed of the arrow keys (and all other keys, for that matter). Not much can be done to help the owner of a PC or a PC/XT, but PC/AT owners are in luck. IBM designed the AT keyboard interface with a lot more flexibility, and part of that flexibility is a capability that allows the user to speed up the keyboard.

The features available via the AT's keyboard interface are explained in the *PC/AT Technical Reference Manual*. Unfortunately, finding out exactly how to invoke those features is an exercise only Sherlock Holmes would enjoy. Not only is the documentation obscure in that area, but someone cut a gaping hole out of the middle of the ROM BIOS listing, and the routine that communicates with the keyboard controller is among the missing or wounded. Once the mess is sorted out,

however, it turns out to be a fairly simple task to change the behavior of an AT keyboard.

The first factor that controls repeat speed is *delay*, which determines how long the key must be held down before it will begin repeating. A long delay insures that keys are not repeated unintentionally. The second factor is *typematic rate*, which determines the repeat frequency once the delay requirement has been satisfied. On the PC/AT keyboard, the delay can range from .25 to 1.25 seconds, and the typematic rate is adjustable from 30 characters per second to 2 characters per second. The default is .5 seconds of delay with a typematic rate of 10 characters per second. These factors are controlled by the program shown in the listing below.

Corporate data, applications software, and a complete back-up system... RACET brings it all together in the ultimate network server. The PCMS™ Personal Computer Mass Storage Sub-system.

This fully integrated data storage system uses high capacity, commercial quality, high performance hard disk drives to provide the ultimate in mass storage for PC networks. The PCMS offers SMD performance in four powerful capacities—100, 150, 240, and 411 megabytes (formatted). And depending upon your application, its total storage capacity can be expanded to exceed six gigabytes. Until now, performance like that was only available for mainframes!

**Integrated software support
for "plug in and run"
simplicity.**

PCMS includes all the software support needed to be completely IBM PC/MSDOS™ compatible.

What's more, it's fully compatible with 3-COM Ethernet™ and other popular networks. Which means a large number of users can have access to centralized resources and data. PCMS software features:

- Public, private, and shared access.
- Volume password protection for maximum security.
- User changeable drive partitioning, with up to 800 volumes per drive.
- Extensive backup/restore software.
- Complete diagnostics, with remote capability.

**High capacity streaming
tape backup.**

Originally designed for mini and mainframe applications, the PCMS backup provides 150 MB per removable cartridge... enough for even the largest storage configurations.

**RACET...providing the
ultimate server solution.**

From single unit PCs to full FAULT TOLERANT SYSTEMS we can provide the PCMS specifically for your application, including customized configurations. So you can depend on the field proven reliability of every system we build. Because they're designed to take over where the small home and hobby units fall behind.

A Bona Fide Bug

Some problems in assembling and linking programs with DOS 2.0 and 2.1 are caused by a bug in the systems software.

When a program fails to compile or link, a programmer first looks for errors in his code rather than blaming the compiler or linker. Systems software is among the most reliable and with the widespread use it gets, any bugs are usually found promptly and reported. Users who have been having trouble linking assembly programs under DOS 2.0 and 2.1 may have reason to blame the system's software—the problem may not be in the code; there is a bona fide bug.

To illustrate such a bug, assemble and link the short program in listing 1. Note that the code is not executable, because it merely allocates data areas. The syntax is perfectly valid and it assembles cleanly, but it generates an "Invalid object file" message from the version 2.x linker. The same object file will link without errors with the version 1.1 linker. The code sequence that generates the error is the allocation of a structure containing an uninitialized double-word, quad-word, or 10-byte field (DD, DQ, or DT pseudo-op with a value of ?). Fields of this length that are allocated directly and not by invocation of a structure cause no problems.

The most obvious way to avoid this problem is to initialize structure fields, either within the structure definition itself or within the angle brackets when the structure is invoked. But sometimes that is not possible, for instance when defining a structure to overlay an area of memory that is written before a program gets control, such as the interrupt vector table or the BIOS data area. In that case, the simplest way out is to define several word or byte fields whose lengths add up to the required four, eight, or ten bytes. This process is illustrated by the program in listing 2: it produces the same memory allocation as listing 1 and will link without problems. (The warning message "No stack segment" may be ignored, since this is not an executable program.)

Although the structures in listings 1 and 2 produce the same memory allocation, they are not strictly equivalent under all conditions. If they were, there would be no need to

ever define a double-word field. The differences arise because the assembler, like some high-level languages, associates a type with each label and variable. Suppose that the first two words of structure S1 are to contain a far address: an offset in the first word and a segment in the second. With the structure defined as in listing 1 (assuming it could get through the linker) a jump or call to that far address could be coded as `CALL VAR.FIELD`.

With the structure of listing 2, the above instruction would be interpreted as a near call to the offset contained in the first word of the structure, in the local code segment. This is because the label `VAR.FIELD` has been declared as a word; the second word of the structure is not logically part of the storage defined by that label. To execute a far call, the instruction must be coded as `CALL DWORD PTR VAR.FIELD`.

Incidentally, I have occasionally found that compiled code (IBM COBOL and Microsoft C) would not link with the version 2.x linker, but would with version 1.1. In these cases, either the compiler generates the equivalent of uninitialized structure fields or there may be some other undiscovered linker bug that is triggered by certain coding structures. Since the programmer can have virtually no control over the structure of an object file produced by a compiler, the only solution is to find a linker version that will work.

A bug in the IBM/Microsoft Assembler (version 1) produces the same symptoms, but for a different reason. The program in listing 3 assembles without errors, but gives the same "Invalid object file" message upon linking. In this case, the source code is incorrect. Notice that the allocation of memory space for the variable `FIELD` is not within a segment; this is illegal and should be caught by the assembler.

Solving Cubic Equations

A subroutine for solving general cubic polynomial equations for many disciplines

A biologist recently asked me to write a BASIC subroutine to solve cubic polynomial equations, in support of a project to develop a mathematical model of the migration of pesticides through the organs of fish.

The formulas needed to solve such a general cubic polynomial equation were worked out by the Italian algebraist Cardan during the first half of the sixteenth century. Cardan's formulas are considerably more complicated than the familiar formulas most people encounter in high school algebra for solving quadratic equations. However, once programmed in the form of a BASIC subroutine, the application of Cardan's formulas is transparent to the user.

Since the solution of cubic equations is a common task in the applied sciences and engineering, this subroutine could find many other applications. The listing below contains a BASIC program that can be used to calculate the roots of a cubic equation to at least five significant decimal digits. The relative order of the coefficients a , b , and c for the equation

are specified to the user in the runtime prompt issued by lines 125 and 130 of the driver. Some of the arithmetic within the subroutine is done in double precision to minimize the effects of round-off errors. Accordingly, the /D option of the BASIC command should be used to invoke the double-precision, transcendental functions ATN, SQR, and COS. (See the IBM *Basic Manual*, revision 2.0.)

The program can be exercised on all three root cases and tested for correct entry on a system by running the following simple examples:

Case 1: $a = -1$, $b = -1$, $c = 1$ with roots -1 , 1 , 1

Case 2: $a = 0$, $b = 1$, $c = 0$ with roots 0 , i , $-i$

Case 3: $a = 1$, $b = -2$, $c = 0$ with roots 1 , -2 , 0

Frank G. Lether, Ph.D., is a professor of mathematics at the University of Georgia. He is a numerical analyst doing work in applied mathematics. Lether has 20 years of experience in computer science.

Ferocious FORTRAN.

Microsoft® FORTRAN crunches numbers with a vengeance!

It combines fast and efficient native code compilation with built-in 8087 coprocessor support. The result? Mini and mainframe performance from your MS™ DOS micro.

Based on the '77 standard, Microsoft FORTRAN supports extensive statements and data types—including complex numbers and IEEE single and double-precision floating point accuracy.

Support for large arrays (greater than 64K bytes), separate module **MICROSOFT** compilation, The High Performance Software and overlays, allow you to create very large programs—up to one megabyte, with access to more than 65 thousand records in a file as large as four gigabytes.

How do programmers feel about Microsoft FORTRAN?

“The first FORTRAN compiler

that takes advantage of the full addressing capability of the 8088 and the power of the 8087.”

—Jack Wilschke, *Softalk*

“We decided to use the Microsoft FORTRAN Compiler for its INTEGER 4 capability and the flexibility of its 8087 implementation.”

—Charlie Huizena & Chip Barnaky, *PC World*

TURN-ON, a phone-activated PC power controller, turns an unattended computer on and off as needed.

RICHARD M. FOARD

The idea of leaving a PC and modem turned on while its user is away is usually dismissed immediately. It seems like a waste of electricity to leave the computer on 24 hours a day and too much trouble to set up a telecommunications program each time—just in case someone might want to call in to exchange mail or data files.

A new product from Skyland Systems may change the minds of many busy or energy-conscious telecommuni-

cators. The product, an ingenious little box called TURN-ON, sits quietly between the telephone and a turned-off computer system waiting for calls. When the telephone rings, TURN-ON answers and switches the computer on, keeping the system powered up as long as the caller stays on the line. When the caller hangs up, TURN-ON flips the power back off and waits for another call.

But, this little box does even more. It protects the computer from damage

by sudden power “spikes,” as well as power surges and other abrupt distortions of the A.C. service. Its six grounded AC outlets enable it to replace a conventional power strip, allowing an entire computer system to be turned on and off from a single switch. Unlike ordinary power strips, TURN-ON does not have a master on/off switch. Instead, one of its outlets is designated the *sense receptacle*. Turning on and off whatever device is plugged into the

sense receptacle controls the power to everything else. Since most power strips end up resting in a pile of tangled wires on the floor, the sense device approach to master power control can save a lot of reaching and crawling. Turning on the monitor, the printer, or even a desk lamp will automatically power up the rest of the system. Any device that uses five watts or more of power will trigger the sense receptacle when turned on.

Another advantage TURN-ON has over conventional power strips is its automatic staging of power. The device plugged into the outlet designated the *CPU receptacle* is switched on two seconds after the others, allowing peripherals to get a head start on the CPU by performing power-on initialization before the computer comes on-line. (Some users might prefer to plug their external hard-disk drives into this receptacle so that the disk will be turned on only after the computer's signals have stabilized.)

TURN-ON's power capacity is ample for microcomputer systems. The CPU outlet handles 7.5 amps, the sense outlet 3 amps, and the other four carry a combined load of 7.5 amps. The box can handle a total current of 10 amps (1,250 watts) to all devices and is fuse-protected. Even though most power strips these days have small, built-in circuit breakers, TURN-ON disappointingly falls back on an older protection technology. Early builds of TURN-ON were not U.L. approved, but all units being shipped today carry the U.L. label and are fully approved.

Enclosed in a 10-by-5-by-3-inch anodized aluminum box, TURN-ON is a compact and attractive unit. It sports a red pilot light that glows when it is receiving power; the light blinks when a call is received and continues to blink after the call is finished, providing a convenient indication that the computer was used while it was left unattended.

TURN-ON can be left connected to the phone line when the PC is in normal use. When the computer has been turned on locally, incoming calls are detected and cause the pilot light to blink, but they are not answered and the computer is left turned on when the caller hangs up. In addition, an incoming wrong number will not shut the machine down in the middle of a job.

Installation of TURN-ON as a power controller is simply accomplished by plugging the computer, modem, and peripherals into TURN-ON's outlets. The sense receptacle must be occupied; aside from a phone call, the sense re-

ceptacle is the only way to bring power up to the other five power outlets. Telephone and modem cords should be plugged into the two modular telephone connectors and, after a little work on the software side, TURN-ON will be ready to use as an unattended bulletin board, electronic mail, or remote file transfer system.

Setting systems software up to get an unattended PC system from a turned-

W*hen the telephone rings, TURN-ON answers and switches the computer on, keeping the system powered up as long as the caller stays on the line; then it shuts off.*

off state into remote control operation is accomplished by using PC-DOS's AUTOEXEC.BAT file to load a telecommunications program, then using the program's facilities to answer the phone and provide service to the caller. With Crosstalk, for example, a system is quickly set up for unattended operation by creating an AUTOEXEC.BAT file that gives the DOS command to invoke Crosstalk, specifying an initial script file

`xtalk autoans (AUTOEXEC.BAT)`

and creating a Crosstalk script file, *autoans*, which begins with Crosstalk commands to set the communications parameters and place the modem into answering mode—for example,

`speed 1200 (Crosstalk script)
mode answer`

This is the minimum amount of set-up work required to get a system on the air as a Crosstalk file server. Configured this way, a PC responds to a telephone call by powering up, loading Crosstalk, answering the phone, and greeting the caller with Crosstalk's sign-on message. The caller is then able to access Crosstalk's remote command facility to send and receive files.

IMPATIENT MODEMS

Calling a system equipped with TURN-ON can be a little trickier in practice than it sounds in principle. A turned-off PC has a good bit of work to do to get itself ready to communicate and can consume a good bit of time in the process.

The PC's power-on self-test can take 50 or 60 seconds, depending on the amount of memory installed. Loading DOS and a communications program takes still more time, especially on floppy-disk-only systems. All this preparation must transpire before the modem answers the phone and raises a carrier signal. It is not unusual for a PC to take a minute and a half to compose itself, and many callers are not that patient.

Modems manufactured by CTS Corporation, for example, by default allow only eight rings before giving up and reporting "no answer" to their controlling software. They can be commanded to wait for as many as 15 rings, but this requires that the host software know how to override the default setting. Even with the modem set to wait through 15 rings, a remote PC with 256KB of memory and floppy disk drives barely beats the timeout. Systems with more RAM simply will not answer the phone in time. Further complicating the situation, call-originating software often imposes its own "soft" time limit on the called system's response time.

TURN-ON's manufacturer recommends a solution to this problem that can be applied by users with modems capable of answering calls on their own. (Most smart modems can be configured to answer a call and establish a carrier signal even though no Data Terminal Ready signal is coming from the computer.) Implementing the solution requires that the modem be plugged into the phone line directly, instead of via TURN-ON, and that a special cable be made up and installed. This cable will carry two of the lines in the modem-to-computer cable to a control plug on TURN-ON. When configured this way, the modem immediately answers incoming calls, detects and responds with carrier, and raises a signal (carrier detect) to TURN-ON's control port, which causes TURN-ON to switch the computer system on. Although it takes more time and trouble to set the system up this way, the arrangement eliminates all timing problems and has the beneficial side effect that wrong numbers will never switch the computer on and off.

This same control port can be used in other, more sophisticated ways. A computer or other device attached via its parallel or serial port to a cable running to TURN-ON's DB25 control port connector can detect whether or not TURN-ON is applying power to the attached equipment and, if it is, whether it was originally turned on by a phone call or by someone turning on the sense device. Through the same port,

CONNECTIONS

TURN-ON can be signaled to turn the computer off and on, or commanded to ignore telephone calls entirely.

Connecting a computer, operating under TURN-ON-mediated power, back to TURN-ON's control port affords communications software substantial flexibility. Using the functions and status signals provided through the control port, software can determine how it was turned on (locally or as a result of an incoming call) and act accordingly. By delivering command signals back to the control port, call-activated software is able to keep its machine powered up after the caller hangs up, or shut the machine's power off in mid-call.

OPTIONAL SOFTWARE

TURN-ON can be purchased with or without a companion \$75 communications software package that includes a user file management system, a log-on control and user validation program, and a file transfer system.

The Skyland software package is oriented toward multiple-user file transfer or bulletin board-style operation, in which many potentially untrustworthy users call and use the unattended computer. Its LOGON program manages a database of user names, passwords, and privileges, and it restricts access to the system using a conventional log-in dia-

tem operator to set up user names in one of three categories: file transfer, special program, or cty. Users in the file transfer category are automatically placed under control of the FILETRAN program on the remote computer when they call and can make use of FILETRAN's facilities for sending and receiving unprotected files and querying the directories of the unattended system. When a special program user logs in, a program previously set up by the system operator is automatically executed and placed in communication with the calling user. Cty users are given full control of the unattended computer by means of the DOS CTTY command.

To take advantage of the TURN-ON package's file transfer capabilities, the calling PC as well as the unattended PC must be running Skyland's FILETRAN program, which uses a communications protocol of Skyland's own invention. Skyland's software license agreement permits a TURN-ON owner to distribute as many copies of the software as he wants, provided that the PC at one end of every conversation is equipped with a TURN-ON device. Prospective TURN-ON users who are not already committed to another communications package will find Skyland's software an attractive option especially if they plan to make their PC available to a wide community

compatible. The Qubie modem, for example, will answer the phone if a ring signal is present while it is initializing itself at power-up—and then immediately drop the line. The Hayes series of modems do not exhibit this behavior. Other modems—particularly the Racal-Vadic Maxwell and Prentice PopCom—also have Hayes-incompatible quirks that interfere with their use in conjunction with TURN-ON.

In my own testing of TURN-ON, using a Hayes Smartmodem 1200, the unit seemed robust and completely reliable and performed as advertised. A test with a CTS Corporation modem caused problems, but because the CTS modem does not claim to be completely Hayes-compatible, neither the modem nor TURN-ON can be faulted.

To individuals and business computer users, TURN-ON offers two kinds of opportunity. It allows those already using PC-based unattended communications to reduce electricity costs and computer wear and tear significantly. At a nickel a kilowatt/hour, TURN-ON pays for itself in power costs alone in just over 30 months by allowing a 300-watt system to operate 8 instead of 24 hours a day. It can increase an organization's productivity, too, by reducing the likelihood that communications attempts will fail because someone left the office in a hurry and forgot to turn the computer or modem on or failed to leave the communications package running.

TURN-ON creates a new opportunity for low volume or off-hours communicators who have previously balked at the idea of leaving their PCs running 24 hours a day. East Coast offices of West Coast companies, for example, can use TURN-ON to stay ready to send and receive files until the close of business, Pacific Standard Time, without running up overtime, electricity, or computer maintenance bills.

TURN-ON's well designed hardware and integrated, security-conscious software reduces the hassle of setting up a remote file transfer system to the point at which many offices and individuals will consider taking their first step into automatic remote data service.

logue. LOGON also records all system activity in a disk file, including unsuccessful attempts to log in.

The file transfer facility, FILETRAN, incorporates an error-checking protocol and allows file-by-file control of user send and receive privileges.

Used together, the Skyland-supplied programs support bulletin board, special-purpose, or general-purpose remote use of the PC by allowing the sys-

tem operator to set up user names in one of three categories: file transfer, special program, or cty. Users in the file transfer category are automatically placed under control of the FILETRAN program on the remote computer when they call and can make use of FILETRAN's facilities for sending and receiving unprotected files and querying the directories of the unattended system. Cty users are given full control of the unattended computer by means of the DOS CTTY command.

According to the manufacturer, some reported problems with TURN-ON have been caused by certain "100-percent Hayes-compatible" modems that are a little less than 100-percent Hayes-

LIBRARIES: Hundreds of Functions for Fast Programming

C is a bare-bones language. It does not have built-in (machine dependent) functions for printing or floating point math or string manipulation. That's why it's so portable. That's also why libraries of pre-written functions are such big sellers: bullet-proof routines your application can effortlessly call to get the job done.

GREENLEAF FUNCTIONS

More than 200 functions in C and/or assembler source, and a 200 page manual with examples and demos.

32 DOS extensions: file and directory manipulation for DOS 1.1 and 2.0.

23 Screen Functions: Select mode, page, monochrome or color, palette; cursor shape, positioning; clearing and scrolling; character reading and writing with attribute and color control; pixel get and put; read light pen.

60 String Functions: Manipulation of strings including center and justify; efficient list operations which add, delete, and sort pointers to strings for top speed.

50 Graphics Functions: Primitives to access all graphics; typeface, formatting, and forms control for IBM Graphics Printer.

Plus keyboard status and function key assignment, time and date algorithms... we could go on!

GREENLEAF COMMUNICATIONS **NEW!**

Want your application to communicate with other users or remote data bases? Now you can build asynchronous communications right into your C programs!

Over 60 functions set up an interrupt driven scheme with separate transmit and receive ring buffers (characters are simultaneously loaded at one end and transmitted from the other, or vice versa) for an arbitrary number of ports. Interrupt control means you can download a record, then halt the incoming stream to file it, display it, let the user tamper with it, send it back up line. It all happens within the context of your program, using your user commands, and does away with the sidestep to the separate communications software (and its semantics) you had to use until now.

The Greenleaf Comm Library supports ASCII or binary, any parity, any word length, 8250 UARTs, all four Lattice C memory models, Hayes 300, 1200, 1200B and other modems.

Its 80-page manual has examples of each function, discusses asynchronous communications, and both the library and demo programs come with source (a mix of C and assembler)!

BASIC_C Use Your Knowledge of BASIC to Learn C

If you're getting the message that switching from BASIC to C would be prudent, you're about to discover that it's fat with basics of a different sort. BASIC is fat with hidden functions that stripped down C just doesn't have.

Gone are all those handy string manipulators like LEFT\$, MID\$, STRING\$, etc. (although our library offerings add them back). In C, when you reach for even simple invocations like INPUT or PRINT A\$,X% — well, sorry to disappoint, but underlying such expressions in BASIC are bulging macros which C cannot have if it is to keep its slim profile.

But now comes BASIC_C and all your old favorites are back. Someone has written the full set of C functions to mimic BASIC's vocabulary, from ABS to WRITE. Over 80 routines to open and close files, "field" file buffers, convert their contents from and to strings (the CV? and MK? series), peek and poke, print using, clear screen, "instr", on error goto... they're all there. Some have reworked names and syntax to suit C, but all are written as one-to-one functional equivalents to the familiar features of BASIC. And they are documented one to a page in alphabetical sequence like the Microsoft manual for added familiarity.

So with BASIC_C, when you're thinking INPUT, go ahead. Use it. Or LPRINT or LOCATE or INKEY. But without BASIC_C, you will find that every line of code plunges you back in the C texts to figure out how to write it. Someday you'll want to, but for now, BASIC_C will state your programming quickly at the statement level so that you can concentrate on C's larger concepts.

There's a bonus: an unusually well-written manual with a first rate chapter comparing how BASIC and C go about their tasks. Without question, BASIC_C will ease your transition to C.

LATTICE WINDOW

All Your Applications
Could Have Windows!

Windows are no gimmick. Ask any user of a windowed product.

But how do you add this technique to your applications without disappearing for several months of R&D?

With Lattice Window.™ A rare programming tool which will change the way you think of program design. Lattice Window takes over all screen management. It is an extensive set of object code functions which you merely call from your C program.

Think of a window as a screen of flexible size. You can tell Lattice Window to open and close up to 255 virtual screens from 1x1 to 255x255 bytes. Then tell "Window" to display any portion of these virtual screens on the physical screen — as many as fit — wherever you want, overlapping and overlaying at will.

Windows no longer needed may be closed. Any background area overlaid earlier (which could be corners of several windows) will pop back to the screen. Think for a moment what a programming job that technique represents. To your program, the entered window is the entire screen — all row and column references are relative to the window no matter its absolute position in the screen. All scrolling occurs only within the active window. The cursor will not leave its boundaries until your program says to.

- You can move a window on the screen.
- You can grow it to display more of the underlying virtual screen. Or shrink it.
- You can control screen attributes (color, blinking, inverse video, etc.).
- You can direct output to either the monochrome or color board.

A formidable product to add incomparable flair to your next application!

BASTOC **NEW!** It Translates Your BASIC Programs Into C

You'd like to upgrade C, but what to do with that warehouse of BASIC routines you've carefully polished over the years? And how to face converting your famous Leviathan accounting system from BASIC, much less your Labyrinth file management package?

With BASTOC,™ a translator which takes in BASIC source code and emits pure Kernighan & Ritchie C. BASTOC understands Microsoft Extended BASIC, both interpreter and compiler forms of CBASIC (except for dynamic dimensioning and common), and can be tailored to understand other dialects. It will optionally convert your program into a single monolithic C function or will decompose it into separate functions, one for each SUBROUTINE.

Strings are dynamically allocated in the target program, ridding your application of BASIC's catatonic halts for garbage collection. BASTOC will try to create structure of even the most convoluted BASIC code, and writes any indigestible statement into the C output as a comment plus explanation. Also, you optionally can tell BASTOC to insert BASIC source lines into the C target as comments.

Source code of several modules of the translator and library are provided so you can tailor BASTOC to your environment if needed. And source of the entire product is for sale.

HALO

A Spectacular Graphics Extension to Lattice C

Halo™ will astound you. It provides a complete library of graphic functions which can be linked with your Lattice programs to create full-color charts, graphs, simulations, even animation.

Over 100 commands are at your disposal, including plot, line, arc, box, circle, plus single commands to produce bar graphs and pie charts. Pattern-fill and dithering commands give your graphics impressive texture and color mixes, rubber-banding draws shapes for interactive users, area moves produce animation, fill and flood commands paint areas. The newest version allows you to define your own world coordinate scheme, divide the screen into "viewports" (windows), and scale graphic figures automatically.

It's a long list of capabilities which make for an extraordinarily powerful product. In fact, Halo is so good that manufacturers of graphics boards and systems are adopting it as a standard graphics language. So it can bridge your application to other systems. CAD-CAM developers, especially, have embraced its device-independent approach for maximal portability. Halo offers a dazzling demonstration that function library architecture will tremendously enhance your firepower.

You'll need an IBM monochrome or color graphics board for our standard version, but other versions now support ten boards and their equivalents. Halo is sold in a one board, one language configuration (special pricing for multiples), but each version now comes with a multitude of I/O drivers for mice and printers.

Tip: Ask us to throw in Dr. Halo for an extra \$95. It's a "paint" program written with Halo, far surpasses other pretenders, and will open up realms of creativity. Brilliant beyond belief.

TO C OR NOT TO C IS NO LONGER THE QUESTION

BTRIEVE

Is a Pro Like You Still Doing the Filing?

If your programming still gets anywhere near the files, here's our guarantee: Nothing will increase your productivity faster than handing the filing job to a sophisticated file manager.

Btrieve™ is the best we have seen. It takes complete charge of all file indexing, reading, writing, insertion and deletion. It builds 22 commands right into the language you use in the form of functions you call to tell Btrieve what to do. The commands create, open, and close files; delete and insert records, recapturing vacated space; find records which exactly or most nearly match keys; walk files by ascending or descending key.

Btrieve's foundation is a balanced-tree indexing scheme, conceded to be the fastest search technique devised (it will find any key in a million-plus item index in four or less accesses).

Btrieve comes with interfaces to C,

Pascal, BASIC, and COBOL, and the manual gives you working sample programs which demonstrate every command in all four languages. The kind of presentation which led *PC World* to exclaim "for those of us who have endured poorly written and inadequate manuals, this one is a pleasure to read."

Btrieve has mainframe specifications! A single file may have up to 24 indexes. Segments of keys may be indexed. Each index can independently accept or block duplicate keys. A record length can be up to 4090 characters; an index length 255 characters. A file may be 4 billion bytes. It can even extend a file across two drives — even two hard disks!

With Btrieve you are freed to think logically; the physical file is no longer of concern. Gone for good is all that time-wasting dicker with intricate file referencing schemes and sorting algorithms. Thinking shifts to a higher plane.

PANEL

IMPROVED!

You've Hand-Coded Your Last Data Entry Screen

Designing custom screens is intricate, time-consuming, and costly. It can make you the loser in competitive bidding. It can add weeks, even months to bringing your product to market.

But not when you use Panel™. Telling Panel your screen design is like using a word processor. You can add, move, copy, delete, and reshape fields with single key commands. The result? Finished C source code with field descriptors, color and highlighting, input editing by type of field, help keys, and warning messages.

Panel's latest version coexists with Lattice Window. Forms and formats can now be designed to overlay, restore, move, etc. under Window control.

Panel supplies source code of keyboard input verification routines, so you can adapt it to any special validation needs. It even includes a multi-key data file maintenance program which interacts with the screen you design. It has all the tools you need to generate code for the trickier aspects of your application.

Panel routines are powerful. Unlike so many programs which make error correction difficult once a field is departed, Panel gives the user full field-to-field movement for editing, and overtype or insert/delete within fields.

A truly superior productivity tool every developer should have.

PLINK86

Size Unlimited with This Overlay Linker

Software is becoming ever more sophisticated, which means more complex programs requiring large chunks of memory. But if you use extra memory, you count on users to have expanded RAM, and forego sales to those who do not.

Plink86™ is the answer. It shoe-horns large programs into small memory. First, Plink86 acts as an alternative to DOS' Link. C encourages design of separately compiled object modules in the Microsoft relocatable format. Plink86 pulls modules together into single compiled programs. But Plink86's overlay power is what has gained it a reputation as a miracle worker. It binds into the compiled program its overlay manager which knows how to swap modules of your large linked program between disk and memory, so that each can temporarily occupy the same memory space.

Unlike other linkers, the overlay manager acts on its own, needing no calls from the source program. Instead, Plink86's straightforward overlay description language allows you to describe your overlay structure in one place in your program — a structure permitting up to 4,095 overlays stacked 32 deep. No re-compiling to re-arrange the structure!

Plink86 can even sub-divide its linked output into multiple files for programs which must span more than one disk. And it produces a symbol map for debugging with Pfix86 Plus.

PC Tech Journal calls it "the premier linker and overlay loader that's taking over at many of the programming shops around the country."

LATTICE C

The Pre-eminent 16-bit C Compiler

C's structured approach encourages development of tight, fail-safe functions which can be counted on to return reliable results every time. Its local variables are unknown outside of functions which safeguard against accidents elsewhere. C offers powerful nested expressions which produce elegant, concise code. That's why C has become the language of choice among professionals.

Lattice C™ is the Number One C compiler. Peter Norton in *PC Magazine* (1/8/85) says, "best for systems programming... tight code... total control of what's going on... noticeably better than any of its competitors." After reviewing nine compilers for the PC, the *PC Tech Journal* unequivocally declared Lattice C "best for software development... it compiles fast and produces fast programs".

Lattice C runs on virtually any computer using an 8088 or 8086 chip, and generates code which optimizes use of the 8087 chip, if present. Create your source files with any word processor or text editor like our Pmate or ES/P for C, and Lattice C will

compile them into Intel 8086 object module format for linking to other modules by DOS's Link or our Plink86.

Lattice C offers a choice of four memory models between 64K and RAM capacity for program and data to allow the program designer to choose the right combination of small memory efficiency and large memory addressability for an application.

Lattice C is a full implementation of Kernighan and Ritchie (K&R), not a subset, with some extra features, e.g., variable names up to 39 characters, and nested comments.

The compiler comes with a library of I/O routines which implement under MS™ DOS most of the Unix-compatible standards described by K&R, and then goes beyond. It has a fulsome set of transcendental and Unix math functions K&R didn't think to mention, and some of Unix's most useful options such as "fork", which can pull a second program into memory without disturbing the first, branch to it, and return.

RUN/C

A C Interpreter at Last — And it Works like BASIC!

C is contemplative, elegant. But even elitists yearn (silently) for the simpler days of throwing together code with the instant interaction of an interpreter.

The good old days are here again. We have not just a C interpreter, but one that acts like BASIC! Use RUN/C's in-line editor to create a program. RUN it, just like BASIC. If it stumbles, just LIST it, EDIT it, add lines, delete lines, RUN it again, fix it again. The simple luxury of break key interrupt is restored, and RUN/C™ even has TRON, TRACE, and a profiler which reports the number of times each program line is executed.

RUN/C's "editor" command will save a program and automatically hand it to your favorite editor for further work. Or you can use its "shell" command to summon your compiler from within RUN/C.

For the professional, RUN/C is ideal for rapid program development. Put up code at high speed, tinker and re-arrange, throw

in test printouts, bang away at tight little sections until they're bullet proof — then hand them to the compiler.

RUN/C has a treasury of functions built into the interpreter — over 100 paralleling the most used functions found in Lattice C's library. Their interface is the same, so if RUN/C can run it, Lattice can compile it. Only programs calling other functions or other libraries for which you do not have source need special measures (e.g., comment-out, dummy functions). Well worth it to win the productivity gains of an interpreter.

Your disk supplies a separate source code file demonstrating each of RUN/C's library functions, with a manual to match. In fact, if you are new to C, this product doubles as a superb tutorial! (Requires 256K, DOS 2.x).

PFIX86

Advanced Dynamic and Symbolic Debuggers

Debugging programs without special tools is like fixing an automobile without lifting the hood. Pfix86™ lets you see inside your program while it is running; multiple windows show program code and data, breakpoint settings, and current register and stack contents simultaneously. You can make changes: just move the cursor into a window and type. It has an in-line assembler, so you can enter program modifications in assembler at run time.

Pfix86 Plus is an enhanced version for use with modules linked by Plink86, even those with overlays. It retains the program

"symbols" otherwise lost during compiling — the names you gave to variables, functions, etc. in your source code — so you don't have to deal with hex addresses.

Both versions have dynamic trace and breakpoint setting facilities. You can then disable them without removal, activate them only upon their nth encounter, halt them when a condition is met. Everything you would want in a debugger.

Reflections of UNIX

The market for PC operating systems has added six important UNIX contenders.

AUGIE HANSEN

Although PC-DOS is several long strides ahead of its nearest micro-computer competitors in the operating system arena, it is still many laps behind the multitasking, multiuser systems, typified by UNIX, in terms of flexibility, convenience, and overall capability. For those who are accustomed to using UNIX, DEC's VMS, Data General's AOS, or other larger time-sharing operating systems, PC-DOS can be confining and often frustrating to use. A PC-DOS-equipped computer spends most of its time doing nothing very fast—usually it is marking time in the gaps between the user's keystrokes.

Several companies, including IBM, sell UNIX systems for the PC or PC/XT. Some are stripped-down versions of UNIX that have been tailored to the PC equipped with floppy disks only; most, however, require an XT and a lot of memory. A survey of the PC and XT UNIX marketplace reveals six important contenders. Three are licensed UNIX AT&T source code descendants: PC/IX,

VENIX/86, and XENIX; the others were written from scratch to mimic UNIX behavior: COHERENT, QNX, and uNETix. Members of the latter group vary in the accuracy of their impersonations, but generally cost less than the licensed versions (see table 1).

AT&T has exclusive rights to the UNIX name, but most companies making UNIX-like systems try very hard to get at least the "IX" part of the name into their products' monikers.

All of these UNIX and UNIX-like operating systems can fill in the idle gaps between keystrokes by letting a user do more than one task at a time, and in most cases, by permitting more than one user at a time to access and use the computer's resources.

PC-DOS users have had a glimpse at a small subset of UNIX features. Each successive version of DOS has added something from UNIX: the hierarchical file system; the **sort** and **find** (like **grep**) commands; redirection; and piping to name a few. Although new to the commercial market, and particularly to microcomputers, UNIX has been in daily use for more than a decade at AT&T and on university campuses around the world. Some 8-bit adaptations (Cromemco's CROMIX, for example) have been in use for about five years. But the real impetus for UNIX growth in the microcomputer market has been the 16- and 32-bit microcomputer sales boom of the past three years.

The UNIX system is written almost entirely in a high-level language (C), so it can be moved readily, although not painlessly, to vastly different host environments. The porting process involves rewriting the machine-dependent parts of the operating system kernel and recompiling the system and applications software in the new environment.

The PC versions of UNIX are modified to varying degrees from the mainstream versions because of limitations of the underlying hardware and due to the philosophies of the companies doing the porting or emulation tasks.

UNIX FEATURES

Aside from the relatively high degree of portability of the operating system itself, a number of other characteristics of UNIX make it attractive to a growing user population. It is a multitasking, multiuser system that greatly improves the CPU utilization and, therefore, the overall throughput of a computer by permitting many tasks to be performed concurrently. Both foreground and background processing are available to users. Redirection of standard input, standard output, and error streams is supported by the user shell that is the interface between users and the operating system. The elegant piping capability facilitates the use of existing tools in custom mix-and-match combinations and encourages the creation of new tools to meet special needs.

UNIX provides a measure of security through its log-in/password mechanism and by file access restrictions. Some installations use multiple levels of password protection (external and internal) to prevent unwarranted access. Each file and directory can be restricted at the user, group, and other levels for read, write, and execute access.

File systems are hierarchical and resemble the root system of a tree. The

root directory of the UNIX file system is called **/** and under it can be any number of subdirectories nested to any depth. File systems may be mounted and dismounted easily. Separate file systems for different parts of a system (system space, user space, etc.) offer a degree of isolation that keeps one file system from corrupting another while permitting ready access and data exchange across file systems. The user

does not need to know what device a particular file system is mounted on. The system maintains a table of mounted file systems and lets the user find files and directories by path names similar to those used under PC-DOS.

A command interpreter called a *shell* provides users with access to system resources. The shell is also a programming language, having the necessary sequencing, looping, and decision-making structures common to all viable computer languages. Several shells are available to UNIX users. The AT&T standard Bourne shell (**sh**) and a restricted version of it (**rsh**) are available on most systems. The Berkeley C shell (**csh**), which has a syntax that is more consistent with the C language and which is especially popular with programmers, is also available on many systems.

In addition, some suppliers are providing visual shells to simplify interactions with UNIX for users whose needs are relatively predictable and limited in scope. Candidates for such menu-driven interfaces are general office workers, word processing specialists, management, or others who have no need to understand programming. Such shells will help to negate the perception of UNIX as being too complex.

UNIX does have a frightfully large set of standard commands, many of which are listed in table 2. A small set of the commands (**cd**, **pwd**, **cat**, etc.) evolved quickly in the early days of

UNIX. Others just grew up out of necessity during the incredibly long gestation period that followed while UNIX was being tinkered with and "commercialized." The resulting inconsistent syntax among commands, seen as a flaw of UNIX, is a result of this relatively unfettered development of the system by many individuals in disparate locations and circumstances. At the same time, that kind of development has led to some of the finest applications and support tools in the business.

Table 3 lists the primary UNIX system administration and maintenance commands. System accounting data can fill up a disk on a busy system in the blink of an eye, so most of the microcomputer versions of UNIX disable the accounting software by default. Other commands are used to create, maintain, mount and dismount file systems, back up and restore disk files, and troubleshoot system problems. The **/etc/cron** command triggers events that are scheduled in a file named **/usr/lib/crontab** (its location may be different on some systems). Events may be added to the crontab file by editing it to instruct UNIX to do tasks at predefined dates and times. **Cron** also runs the **sync**, or **update**, command frequently (usually once a minute) to keep essential file system data up to date on disk. That happens even if no crontab file exists.

A primary use of UNIX is the preparation and management of documents of every description. Table 4 summarizes the major commands used for text processing. Unlike most of the word processors for PC-DOS, which use a single program for editing and on-screen formatting, UNIX uses separate editing and processing steps. The line and screen editors are treated as part of the basic set of system commands because they are primary tools for the manipulation of text in a wide range of applications—from creating mail items to preparing program source files.

The major disadvantage of this approach is a lack of realtime feedback on the appearance of a document. The user must process a text file, which often looks more like a program source file than a document, to see what will actually be printed. The advantage to this method is that a single source file can be produced in a variety of output formats simply by changing the formatter parameters, usually through a set of macro definitions in an optional formatting package. Source files also consist of only standard printable ASCII characters, making them easy to transmit through simple networks.

The primary text processing programs are **nroff** for printing terminal output and **troff** for typesetters. Several preprocessors are used to handle equations (**eqn** and **neqn**) and tables (**tbl**) merged with normal text. Other preprocessors may be used to handle graphics in what is essentially a bit-mapped mode if suitable hardware (a laser printer) is available.

Other commands in this set automate testing of documents for style, readability, spelling, and typographical errors. Some filters are provided to permit text processor output to drive printers with limited capabilities. **Col**, for example, lets line printers that cannot do reverse linefeeds handle text that contains them by buffering the output and simulating the reverse motion through the use of backspacing and carriage returns. A permuted index (sometimes called KWIK for key word in context) may be prepared automatically by **ptx**. **Deroff** strips formatting commands out of document source files so the files may be processed by other programs that would produce erroneous results if the commands were left in. For example, the word count command, **wc**, would report higher numbers than it should for character, word, and line counts if the source file were not **deroffed** beforehand.

Another major use of UNIX is development of software. Table 5 lists the primary programs in this set. The range of programming tools spans preprocessors, compilers and interpreters, assemblers, linkers, and various testing tools. Of course, the primary language tool is the C compiler, but UNIX has support for FORTRAN (**f77** and **ratfor**), SNOBOL (**sno**), and even BASIC on some systems. Many installations also have the Berkeley Pascal interpreter and compiler available. **Lint**, the C source program checker, debuggers such as **adb** (and sometimes **sdb**), and assorted tools, such as **cref**, **time**, and **ctags**, aid programmers in the debugging and maintenance phases of their work.

In addition, UNIX has a full set of management tools to assist users in the software engineering aspects of major development projects. The basic management tool is **make**, which uses **makefiles** to control the process of building programs from a variety of sources. SCCS (source code control system) takes the management of a software project further by providing a means of storing multiple versions and releases of a product in a convenient, easily audited way. Multiple versions of a source file are managed by maintain-

ing a base file along with delta files that can be used to recreate any version of the source while conserving disk space. Some systems have RCS (revision control system), a newer alternative to SCCS that was developed outside of AT&T/Bell Laboratories. It reportedly has a more friendly user interface than SCCS.

Additional components of the development set include screen management tools such as **curses**, **termcap**, and **terminfo**. These functions and databases are used heavily in programs that must manipulate the screen of a video console or terminal directly.

Program libraries are an important part of this set, too. Prepackaged routines for processing strings, doing mathematical operations, and handling graphics interfaces are provided. C is a compact language that does not have any built-in I/O, so standard libraries that are portable across many machines and operating systems are essential.

UNIX provides several layers of communications support. Because many users access a system via remote terminals, either dedicated lines or dial-up

ports or a mix of the two are primary components of a UNIX system. When feasible, direct connections are best because the transmission rate can be set to the maximum allowed by the host's serial ports and the terminals. However, many more users are often assigned to a system than will actually be using it at any given time, so a balance must be struck between dedicated ports and dial-ups that best serves the needs of the user population.

For remote access among geographically dispersed systems, **uucp** (unix-to-unix copy) is used, along with related programs in the family. **Uucp** copies source files to destination files, where the source and destination may be on the same system or on systems that are far apart. Electronic mail and news distributions depend on **uucp**. A loosely connected network of hundreds of UNIX sites covering much of the free world exchange news, program source code, gossip, and electronic graffiti on a daily basis. The **uux** command (unix-to-unix execution) can access a remote system, run commands on it, and send

UNIX has its critics. So does AT&T for the way it has handled UNIX in the marketplace. The company is often accused of being too slow to react to perceived customer needs. Some complain that UNIX has grown too big and complicated; long ago the system outgrew the stage at which its users could re-read the entire system documentation over a weekend to refresh their memories. UNIX is infamous for its number of commands, often obscurely named, and numerous options.

The most notorious UNIX critic is Don Norman, director of the program in cognitive science at the University of California at San Diego, who wrote an internal memorandum at UCSD that eventually became an article called

"The Trouble with UNIX" in *Datamation* (November 1981). In it, Dr. Norman lambastes the user interface, saying that "UNIX is a disaster for the casual user." Other critics of the system add to the list of complaints, although most, including Dr. Norman, continue to use UNIX for lack of a better alternative.

Inconsistent command syntax has been a frequent complaint about UNIX. Compounding the problem that it causes is a general lack of mnemonic names. Most command names are cryptic, a few misleading, and others just plain out in left field. The pattern scanning and processing command, for example, is called **awk** (the first letters of the last names of the program's creators, Aho, Weinberger, and Kernighan) instead of a more logical and useful word, such as **patscan**.

One potential disaster for any UNIX user, from novice to experienced, is the unintentional misuse of the remove command, **rm**, with wildcard file specifications. A simple **rm *.o** (the * means any matching string of characters) will remove a group of files from

a directory. Typing **rm *.o** (with an extra space) is an easy error to make, but an extremely costly one—it results in *all* the files in the current directory being silently deleted, followed by an error message, "rm: .o non-existent".

In self-defense, many UNIX users have created work-arounds to avoid this problem. Typically a private version of the **rm** command is created and put in a directory that is searched before the **/bin** command directory. The private **rm** command alters the behavior of **rm** to make it require confirmation, or it simply moves the deleted files to a temporary directory, giving the user a means to recover in the event of an error. One recommended change to the **rm** command causes it to be more verbose, prompting for confirmation by default. This feature can be disabled by a new option flag, **-s** for silent, so **rm** could be used in pipeline commands and shell scripts in the usual manner. Such a change would, unfortunately, break a lot of existing shell scripts.

Another often heard complaint concerns the unwanted loss of existing files with the copy (**cp**) and move (**mv**) commands. Both will silently overwrite a file if it already exists. For example, typing **cp filea fileb** would destroy the contents of **fileb**, if the file existed, and would copy the contents of **filea** into **fileb**. UNIX does nothing to warn of the existence of **fileb**. Berkeley UNIX solves this problem with a **noclobber** variable in the user's environment that requires a special assertion before overwriting of a file takes place.

UNIX System III provides no record and file locking features, so it is possible for two or more users to modify the same file or record simultaneously. None of the users is warned of the potential conflict, and no attempt is made to prevent multiple, simultaneous access of the same items. When users are confined to their own directories and files, such conflicts do not occur, but in database applications, for example, such collisions can have dreadful consequences. Berkeley UNIX uses a file system design that includes file locking mechanisms. XENIX, the Santa Cruz Operation's UNIX implementation, uses file locking that gives a controlling process complete access and the ability to block access from any other process to all or any portion of the locked file.

XENIX also uses semaphores to control access to system resources. A semaphore is a regular file entry in the file system, but the file contains no data and it can be accessed by only one process at a time. Processes competing for

SUBJECT: Engineering a LAN for Maximum Flexibility.

Quantum Software Systems Ltd. proudly announces QNX 2.0 — the Ultimate Distributed Network Operating System. QNX 2.0 is now available for the IBM-PC, IBM-AT, PC compatibles, DEC Rainbow and TANDY 2000. If you have been waiting for a Real-time Multi-tasking Multi-user Operating system with fourth generation LAN support, then QNX 2.0 can offer you today what the competition can't even begin to promise for the future.

QNX 2.0 integrates the Local Area Network architecture right into the heart of the operating system, at the fundamental level of intertask communication allowing tasks to communicate transparently with other tasks across the whole network. This means that any task (program/application) may access ANY serial port, ANY printer or ANY disk on the network. There are no artificial restrictions. Every PC with a disk is a potential file server. PCs without disks will automatically BOOT over the network.

QNX on the IBM-PC AT:

QNX is the first Multi-tasking Multi-user Operating system available for the AT. It is available in both networked and single machine configurations. At about 2.5 times faster than the QNX 8088 PC based systems, and 10 times faster than other multi-tasking operating systems on the same processor, QNX is the ideal program development environment.

O/S	Computer	Processor	Measured time
QNX™	IBM-PC AT	80286	480 usec
XENIX™	Intel-286	80286	4,930 usec

File Security:

Designed with extensive file security features, QNX 2.0 provides login protection with network wide file permission checking based on 255 groups of 255 users. In addition, each PC user may control network access to devices attached locally to their machine.

Distributed Processing:

The QNX LAN supports distributed processing as well as distributed devices. Tasks may be executed on remote stations as easily as they may be executed on the local work station. This allows pure processing elements (PCs without keyboards or displays) to be plugged into the network to be used as an

un-committed processing resource. This is ideal for real-time, process control, data acquisition and data communication applications.

Global Communications:

QNX supports a full implementation of X.25 allowing connection to public networks such as Telenet and Datapac. This allows you to link geographically separate LANs together providing true global area networking.

Cost Effective Growth and Flexible Solutions:

QNX is affordable, and will work with the PCs you use today and those you will use tomorrow. You may mix and match different brand PCs on the same QNX network with absolute ease. Multi-user expansion may be accomplished by adding terminals to PCs or PCs to the network. You can start your multi-user application on a single PC with 1 to 10 attached terminals. Once your single processor starts to show signs of degradation, add another PC and connect terminals to the new processor. If the disk becomes the major bottleneck, you may add hard disks to other attached PCs to distribute the processing. Applications which are very CPU intensive may wish to limit a single user to each processor and expand the system with low cost diskless PCs used as work stations. QNX does offer a truly cost effective and flexible solution to your applications needs.

Portability:

QNX 2.0 is portable. The operating system is independent of the physical local area network. It is available in a form suitable for porting to other 8088/8086/80186/80286 computers in the consumer, educational and industrial market place. QNX is ROMable and can operate in as little as 128Kb RAM.

DOS Compatibility:

PC-DOS version 2.1 can run as a task under the QNX 1.2 or 2.0 operating systems. QNX will also allow transparent access to the DOS file system partition and floppies.

QNX Products:

QNX Operating System	PC-DOS Emulator
Full Screen Multi-terminal Editor	Electronic Mail
Extended Utilities	Electronic Teleconferencing
C Compiler & 8086 Assembler	Full Screen Menu Developer
Basic Compiler	Isam File Utility
Qbol (dibol) Compiler	Networking Board
Text Processor	OEM Customization Kit
Real Time Spelling Checker	(to port QNX)

Established:

Quantum sold over 10,000 copies of its operating system during 1984, into all business systems environments, to developers of real time applications, government and educational systems, to software developers/integrators, universities and research establishments.

the same resource—a port or a data file, for instance—must wait for the currently controlling process to give up control. Standard library functions are provided for the C compiler to implement these capabilities in programs.

Because of a fundamental “fairness doctrine” built into AT&T’s production UNIX, the system has no realtime capability, leading to more complaints about UNIX. The scheduler tries to parcel out the limited CPU resource to all request-

ing processes in an evenhanded manner. Processes that are time-critical cannot be guaranteed sufficiently frequent access to the CPU. In scientific and engineering applications, realtime support is essential, so UNIX has been modified in many ways to provide it.

Within AT&T are numerous modified UNIX systems and derivatives that are used in realtime applications, such as those found in telephone switching systems. Company officials in charge of

UNIX development freely admit, however, that they do not fully understand realtime needs and state that UNIX and realtime probably never will be synonymous. Current versions of AT&T UNIX (System III and System V) are sold as general purpose systems that make no pretense at having realtime capabilities.

PERSONAL COMPUTER PHOTOCOPIER

Have you ever wished that there was a machine for your PC that could scan your photographs, artwork or documents just like a photocopier? And was as easy to use and understand? As well as copy and store in color or black-and-white onto your hard drive for editing?

Well, there is such a machine now. It's called the **LaserFAX** digital photocopier. We got tired of trying to use digitizing tablets, cameras, mice and everything else that has been invented. The **LaserFAX** machines will scan any and all of your art, photos, forms or text for storage in your PC. Images that you can cut-and-paste into your word processing or database programs. Our **SpectraSCAN 200** will scan and store your color images for editing and printing on your color printer at resolutions up to 200 dots per inch. The **LaserFAX DS-200** will do the same for you in black-and-white. Then the **LaserFAX Graphics Editor** software that we bundle with the scanner will allow you to cut-and-paste your images, rotate them, enlarge and reduce whatever pictures you choose.

That's not all. Our digital photocopiers are based on open-architecture design, which means that as new uses for this technology develop, add-on cards can enhance our **LaserFAX** digital photocopier. But we didn't want to wait for third-party vendors, so we invented two optional boards of our own: the **LaserFAXimile Card** and the **LaserFAX TEXreader**. The **LaserFAXimile** card takes advantage of the 200 dots per inch resolution of the scanning device to turn it into a facsimile machine. The **TEXreader** board is a revolution in itself — full-scale OCR (optical character recognition) to read typewritten pages with the **LaserFAX** machine into your word processor without having to re-type what somebody else has already typed.

What's most amazing about the **LaserFAX** product line, though, are the prices. Our basic black-and-white digital photocopiers cost about the same as a regular office copier (which you may never use again!) and our color scanners cost very little more. Because we know high tech has to be affordable.

with text processing and program development. Clearly, some systems are more faithful to UNIX than others.

each of the products surveyed in this article. The cost of each system is given for both bundled and unbundled configurations where applicable. AT&T traditionally has sold UNIX as a bundled system, but it, too, is moving toward unbundling some elements of the system to effect a more attractive entry price for the basic system.

The minimum and recommended hardware configurations shown in table 1 define another part of the cost of switching to UNIX. If the necessary hardware is not already on hand, this can be a substantial component of the total system acquisition cost. Of course, the ability to use one computer with several inexpensive terminals can easily bring the per-user cost to an acceptable level when compared to the number of stand-alone systems needed to establish an equivalent configuration.

The accompanying tables do not cover every available UNIX command.

They are comprehensive enough, however, to show how well each of the PC UNIX systems mimics UNIX behavior. AT&T UNIX System III is used as a basis of comparison throughout this survey, although some of the products were modeled after an earlier AT&T UNIX, version 7. Commands taken from Berkeley UNIX are included where appropriate. None of the systems tested uses the Berkeley file system and kernel modifications, but several infuse many of the popular Berkeley utility programs.

PC/IX

PC/IX, a product that is sold under the IBM label, was ported to the 8088 from AT&T System III source by Interactive Systems, an IBM vendor of choice for mainframe systems software. This single-user UNIX derivative seems to be a solid, trouble-free implementation of UNIX. It has none of the Berkeley extensions that are provided with some of

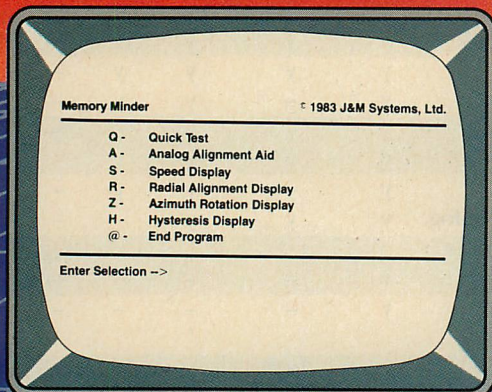

the other products, but it is faithful to UNIX in every respect.

Interactive Systems offers the **INed** full-screen editor instead of the **vi** editor. **INed** has an unnecessarily complex command structure, awkward cursor movement (no forward and back one-word-at-a-time, for example), and a mystifying line-insert capability. Although the **vi** editor also is complex, it has a more consistent user interface and more predictable behavior.

PC/IX has modules for program development and text processing. They may be installed if needed, or their disk file allocations may be held for user work space. The C compiler supports the small model only (64KB text and data), which is one of the reasons **vi**, a very large program, is not supported. Another reason may involve the licensing of PC/IX as a single-user system. **INed** has been designed to work directly with the PC display and cannot be

... A UNIQUE APPROACH TO DISK RELIABILITY!

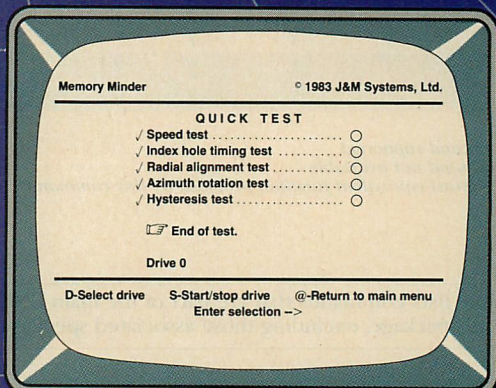

Select any one of seven tests to perform preventive maintenance or to isolate problems. Simple, single-letter commands make MM easy to use! Use MM to align the head, or adjust the speed.

Use the MM Radial Alignment Test to check the head alignment of your drives. No need for an oscilloscope or other expensive test equipment!

Check the motor speed of your drives. Or, you can even use the Speed Test to adjust the drive speed. No need for any test equipment!

Use the Quick Test to quickly and automatically test five of the most important performance parameters of your drive. Monitor your drives for long term drift. Isolate problems quickly and automatically!

PROTECT YOUR DATA.

Now you can make sure your data is being recorded properly by the use of the revolutionary **Memory Minder**.

The Memory Minder from J & M Systems, tests your disk's performance and calibration without any additional equipment! It measures your disk's performance and displays it on your screen.

This is the most comprehensive disk diagnostic program available for your IBM microcomputer. You can even adjust drive alignment while watching the display!

Spot problems *before* they endanger your data! If you own a disk drive, you *need* the **Memory Minder**!

¹The accounting functions are performed by a set of related commands. System III accounting software is emulated closely by PC/IX, XENIX, and COHERENT. Accounting is disabled by default on all systems.
²VENIX uses a simplified form of login accounting on a per-user basis.

Commands used to administer and maintain a typical UNIX system are usually reserved for authorized personnel, although some are available to the general user population.

¹SCO credits the University of California/Berkeley for these programs.
²QNX has its own text processor called *doc* that is not compatible with any UNIX text processing tools. uNETix supports text processing via its DOS emulator using available DOS editors and word processors in addition to text editing with the optional *vi* editor.

This table lists commands that are used to process text files. Such files may be created or modified using one of the line or screen editors that are listed in table 2.

used over a tty connection, although the use of dial-up ports is supported.

PC/IX includes no compilers for FORTRAN, Pascal, or BASIC. The compiler/interpreter **bs**, which is a blending of BASIC and SNOBOL with a C-like syntax, and a SNOBOL interpreter, **sno**, are included in the program development package. The package also contains all of the development support programs, such as **make**, the SCCS utilities, **lint**, and others that ease the burdens on programmers and software engineers in creating, testing, and maintaining programs.

The user interface is the standard Bourne shell—no others are offered. All of the standard UNIX commands

worked just as they should. A new command, **li**, does the same job as **ls**, the directory lister, but produces a columnar output, which is more useful on video displays than the linear presentation of **ls**. The help command is included, but the production version of PC/IX has no help file entries in order to save disk space. Users can create their own help files if they wish.

For communications, PC/IX uses a program called **connect** instead of the UNIX **cu** program. It supports a Hayes auto-dialer and can be configured for other intelligent modems as well. Some bugs related to the serial ports have been reported—resulting in a locked-up system and a reboot.

Curses and the **termcap** database are available in full-screen applications. The **/etc/termcap** file appears to be current in its coverage of terminal types. Also, IBM has provided a PC-DOS connection at the disk file read/write level only, but that makes it possible to transfer program source files and standard text and data files between environments. No DOS emulation or cross-development features are included.

IBM's documentation, which is dressed to kill in pin-striped binders, is nicely produced from the original AT&T memos and manuals. Additional documents written by Interactive Systems cover the **INed** editor, **connect**, and other non-UNIX features.

A NUMERICAL CONCEPT NO OTHER MONITOR CAN COMPREHEND.

As sophisticated as they are, you'd think monitor companies could solve a simple problem: keeping customers happy.

Fortunately, Amdek can. With the longest warranty in the industry. Namely, two years on all parts and labor. And three years on the CRT.

Even simpler, our warranty applies to every monitor we make, from our new Color Series to our amazingly popular Video Series.

And Amdek's own trained technicians make repairs quick and professional.

So when you're shopping for a monitor, look at the quality Amdek guarantees you, years after you leave the store.

According to our figures, it really adds up.

²Uses Lattice C compiler and associated Lantech Software Tools package

UNIX is known for its stellar program development commands, including compilers, interpreters, software

engineering tools, and program verification and testing tools. A shortfall of uNETix is its scarcity of development tools.

A new version designed for the PC/AT is now available. PC/IX 1.1 runs on an AT in the real address mode, limiting memory addressing to 1MB. The C compiler still is limited to the small model. The upgrade fee is \$40.

VENIX/86

UniSource is the exclusive licensed distributor of VentureCom's VENIX/86. In its current form, VENIX/86 is a port of AT&T's version 7 UNIX with many Berkeley extensions, including vi, the columnar version of the directory lister (ls), and the C shell (csh).

Because of its earlier vintage, VENIX/86 is a bit leaner in the UNIX commands it includes, compared to the two other licensed versions, PC/IX and XENIX. It occupies less disk space, leaving more room for user files or other operating systems. Several types of mass storage devices are supported. A second fixed disk installed on an XT must be the same type and size as the first for VENIX/86 to use it; DOS may reside on the disk with VENIX/86.

A full BASIC interpreter (which is a nonstandard UNIX program from the

University of British Columbia) is available in addition to the C compiler and its support tools. No other UNIX language programs are included.

VENIX/86 compiles C programs in about the same time as a moderately loaded PDP-11/70 running BSD 4.2 UNIX. Because VENIX/86 is based on version 7, it does not have SCCS tools, commands for packing and unpacking files, etc. A set of DOS utilities are provided to permit exchanging files between DOS and VENIX/86.

The UniSource distribution includes a feature called Quad-Screen Picture Windows. Each window is a full screen and may be used to monitor a task or serve as a separate log-in port.

Someone with "super user" privileges can use the nice command to set very high priorities for tasks that require realtime attention. This is done at a serious performance cost to other running processes.

The documents for VENIX/86 are in five volumes, spiral-bound so that they lie flat. A few sections have acceptable indexes, but most have none. The dividers have no tabs and are fairly stiff, so it

is a little difficult to flip through the pages to find subjects quickly.

UniSource provides VENIX/86 already installed on a fixed disk, ready for installation the easy way. Another company service allows potential customers to call a UniSource-supplied number and log in as a guest for a test drive on an IBM PC running VENIX/86.

AT&T is reportedly buying VENIX/86 for use on its PC 6300, and UniSource has announced that it will release System V VENIX, a version based on UNIX System V, in 1985. This version will provide binary compatibility across microcomputers so that the same software can be run on an XT, a DEC Rainbow, and the AT&T 6300. (At UniForum in Dallas last January, the Data General/One was running a floppy disk version of VENIX. It had the vi text editor, but no C compiler was available.)

EVEREX EVER FOR EXCELLENCE

The Everex Hard Disk/Backup Systems Are Your Expansion Systems too...with little additional cost.

More Room To Expand, Not More Money

Think about Off-loading expansion boards from your PC or XT to an External Hard Disk/Backup System. Everex provides a complete line to choose from...

- Full-size system with eight expansion slots and room to add up to four hard disk/backup systems.
- Half-size system with four expansion slots and space for two hard disk/backup systems.
- Slimline system, only 2½ inches high with three full-size, one half-size expansion slots and room for two hard disk/backup systems.
- All Expansion systems are available with any combination of Everex hard disk drives and backup systems.

Unique Features

- One shielded round cable (as IBM) instead of flat ribbon cables.

Replace the clumsy flat ribbon cable with Everex's *shielded, round* cable.

- Advanced design eliminates "wait states" for faster data transmission.
- Compatible with more controllers than other systems.

EVEREX
EVER for Excellence

sue of *PC Tech Journal*.) XENIX is a complete and competent system, blending a full and faithful UNIX System III with a set of useful Berkeley extensions and custom applications in a well-designed package. The system has been unbundled into three major packages that may be purchased separately. As the tables show, XENIX is a nearly complete UNIX implementation—only a few commands have been omitted.

XENIX has the most complete text processing package of any of the tested products. The memorandum macros (**mm**) package is supported by XENIX. Although loading all of the programs onto disk is not necessary, it would not hurt to do so if document preparation is to be a significant activity. If a suitable typesetter or printer is available, **troff** is a good choice. Otherwise, **troff** can be left out and **nroff** used instead.

Release 1.2 of the XENIX Development System was tested for this article. It is a complete UNIX software development package that also contains a set of useful Berkeley programs—**ctags**, **strings**, and **xstr**—that help bring order to the chaos of large-scale program development. In addition to this, the UNIX source code control system (SCCS) is provided. XENIX has neither **f77** nor **sno** in this release.

CMERGE is a recent addition to XENIX. It is a cross-development system that facilitates the creation of programs under XENIX for MS-DOS and PC-DOS machines. Appropriate libraries are provided to permit running and testing programs in both XENIX and DOS operating environments. Both the large and small models are supported for DOS programs, but only the small model may be used for XENIX programs in this release of the CMERGE compiler. A future release will add large-model support for 8086 XENIX.

In its current production version, XENIX can use one or two fixed disks with partitions of up to 16MB. SCO can describe methods of working with various brands of disks and controllers and XENIX can be configured for larger disks if necessary. I have loaded XENIX onto a 26MB disk in a modified PC/XT in a 16MB partition with PC-DOS in the remaining 10MB without any difficulty. Ideally, all XENIX system files should be on one fixed disk with all user file systems on a totally separate fixed disk. Since the IBM fixed-disk adapter can control two fixed disks, it's a relatively simple job to set up an XT this way to increase user file space.

XENIX uses color effectively, if it is available, and can run up to ten virtual

terminals on the console. One virtual console (screen plus keyboard) may be active at any time. There is no provision for windows nor for simultaneous viewing of virtual consoles.

The Santa Cruz Operation provides five binders chock full of documentation. Two binders accompany the basic system, one comes with the text processing package, and two with the development system. The print quality of

XENIX is a complete and competent system, blending a full and faithful UNIX System III with a set of useful Berkeley extensions and custom applications.

the documentation is not as good as it could be, but the coverage is complete and the documents are well written. SCO adds some good starter tutorials that will help newcomers overcome the fear that is often associated with learning a system as complex as XENIX. Release notes now accompany each package, detailing which files are on each disk and providing special instructions that speed installation.

SCO has earned a reputation for excellent customer support of its XENIX products, offering reasonably priced service contracts at several levels of support and responding quickly to users' requests for assistance.

Microsoft and AT&T recently reached an agreement that will have Microsoft porting the latest official AT&T version of UNIX, so in the not-too-distant future, XENIX should be compatible with the standard version. SCO is planning to introduce its System V very soon.

COHERENT

Mark Williams Company's COHERENT system was introduced a few years ago to run on a standard PC equipped with a Corvus 5MB add-on hard disk. It was somewhat buggy and slowed down quickly under load, but was a remarkably complete version 7 UNIX look-alike. It has been improved and expanded in the intervening period and supports many of the major UNIX features. This is the most UNIX-like of the three look-alike systems tested.

The system is shipped on seven double-sided floppy disks (it used to be on 19 disks) and it can be installed in about 50 minutes using the installation procedure provided. The current installation procedure is less prone to fatal errors than were earlier versions.

COHERENT provides no **cu** or **uucp** functions. It includes a small model version of the Mark Williams C compiler. (Another compiler comparable to the Mark Williams MS-DOS C compiler, which can produce large model programs, is expected soon.) A reasonable set of program development support tools is included (see table 5).

The **nroff** text processor uses the manuscript macros (**ms**). The system has no **troff** or equivalent program for typesetters, but few users will notice until laser printers are much cheaper and in greater abundance.

Fixed-disk support is excellent. COHERENT will work with a partition of at least 5MB on an XT or on external disks by Corvus, Davong, Micronetics (SASI controller), and Tecmar. Any disk size (5-, 10-, 15-, and 26MB) may be used for either or both fixed disks.

The COHERENT documentation is the least well-packaged of the products reviewed here. The two bulky 8½-by-11-inch binders are filled with single-sided pages. However, the coverage and quality of the text is good, and excellent indexes accompany each of the major sections, a feature that is lacking in the documents provided with some of the other systems.

QNX

Quantum Software Systems has profited from being one of the first companies to supply a multitasking, multiuser operating system for the IBM PC. QNX is noted for its compactness and speed and the amount of usable business and networking software already available for it. It is suitable for realtime applications, too. Its scheduling algorithm allots shorter time slices and allows priorities to be assigned to processes to guarantee scheduled time.

Despite the similarity of its name (the original name, QUNIX, was shortened to QNX voluntarily by Quantam because it felt the name was too close to the real thing), QNX is not UNIX at all—although the two systems have several features in common, such as a hierarchical file system, C as a primary high-level language, and a few similar commands. In addition, some users will be disappointed in this system's lack of compatibility with UNIX syntax and overall capabilities in program develop-

ment and text processing. Recent versions of QNX have public domain versions of **make**, **lex**, and **yacc**.

The command names and options differ markedly from those of UNIX. For example, the UNIX **wall** (write all) command becomes **apb** under QNX, **pr** becomes **list**, **echo** becomes **type**, **ps** becomes **task**, **rm** becomes **frel**, and **rmdir** becomes **drel**. QNX has a word-processing style visual editor called **ed** and a line-by-line editor, **led**, which is similar to the UNIX **ed** program.

QNX has enough maturity to be relatively bug-free. Now Quantum is putting much of its energy into expanding the applications software base. New applications include a menu interface, an electronic mail system, a new BASIC compiler, and a raft of databases and spreadsheets to complete business management and accounting systems.

Earlier versions of QNX did not use floating-point software, so if a host machine did not have the needed hardware, programs were necessarily integer only. That has been changed in the latest version, which now has software floating-point routines that are used automatically when no 8087 math coprocessor is found to be present.

QNX uses shared runtime libraries and common modules for assembly, linking, and loading of programs. Only the compiler module differs for each supported language (C, BASIC, Pascal, Dibol). The size of executable programs is very small because of the runtime library approach, permitting a large number of files to be stored on each disk, but the full library must be memory-resident at all times. Yet even under those circumstances, QNX is able to run in as little as 128KB and can be placed in the computer's ROM.

The designers of QNX did a nice job of handling primary and secondary storage. QNX has drivers for a wide range of floppy and fixed disks and even for RAM disks of very large capacity. The latest release also runs on the AT in real address mode.

A local area networking version of QNX, 2.0, allows users on the network to share files and devices.

uNETix

This UNIX-from-scratch product by Lantech Systems provides an inexpensive way to make a gradual transition from PC-DOS to UNIX. The price is \$49.95 for the UNIX-like kernel, a DOS emulator, and basic utilities. Each of the specialty modules, such as the Lattice C compiler, windows, the **vi** editor, and a VT100 terminal emulator cost extra.

The version of uNETix tested is single-user and can run on a floppy-disk-only system or on an XT in one or more partitions on the fixed disk. A multiuser version is also available. Either version must be booted from the master kernel floppy disk, but will run entirely from the fixed disk once the kernel is loaded into memory. File systems on floppy or fixed disks may be easily mounted and unmounted using

A massive effort is underway to enhance the acceptability of UNIX systems to nonprogramming professionals, especially to those who are business users.

standard UNIX commands. In fact, all optional features are delivered as mountable file systems with individual shell scripts that handle most of the messy work of installation.

The operating system is not fast, but it has adequate speed for most users, even when running several tasks simultaneously. uNETix implements only about one-third of the basic UNIX commands, and the shell lacks looping and flow control statements, so most existing shell scripts will be worthless under uNETix.

Some of the commands exhibit nonstandard behavior. The **pr** command, for example, recognizes several optional arguments that modify its operation, just as the UNIX **pr** command does, but under uNETix the options must be separated from each other and introduced by a dash; the UNIX **pr** command can take the options in groups with a single leading dash. Also, a simple shell script to print a columnar directory listing breaks because the **-t** option cancels printing of the header but not the footer, and the multicolumn feature does not work right. So, a UNIX shell script such as **ls | pr -t5** fails to produce the required output, even when it is typed with separate arguments (**ls | pr -t -5**) as required by the nonstandard syntax.

What makes uNETix especially attractive, besides the low price, are the DOS emulator, the windowing feature, and the integration facility. These permit multiple tasks to be run concur-

rently and data to be copied and spliced between tasks in a variety of ways. The integration facility even has a learn mode that memorizes sequences and relations and can apply them to other data sets, for example, to copy selected cells from a spreadsheet (running under DOS of course) into a database maintained by uNETix.

The windows can be treated as up to ten separate consoles, or they may be overlaid on a single screen. The DOS emulator executes as a task under uNETix from any window and can run many of the best-selling programs designed for PC-DOS—although this operation requires a lot of memory. To run DOS built-in commands, 320KB is needed; and 448KB is needed to run a typical application that would require 128KB under DOS.

Lantech used the Lattice C compiler for uNETix. A few revisions were made to the compiler package to emulate the UNIX command syntax and operation of the various steps in the compile, assemble, and link sequence. The compiler produces reasonably sized program files that load and run quickly. A Lantech assembler and support tools are provided with the compiler.

The shortfall of uNETix, when compared to UNIX, is most clearly seen in tables 4 and 5. It has virtually no text processing capabilities and only a few program development tools. As an introduction to UNIX and networking, it is a dandy package. As an environment for serious design and development work, it leaves far too much out to be of value to many users.

SPECIAL FEATURES

A massive effort is underway to enhance the acceptability of UNIX systems to nonprogramming professionals, especially users who are in a business environment. For that reason, UNIX providers are promoting visual and menu shells, DOS emulation facilities, multiple virtual consoles, and various forms of windowing for UNIX.

A DOS emulation facility permits DOS to run as a task under UNIX, making nearly all existing DOS programs available to UNIX users immediately. This requires a great deal of memory, especially for programs such as Lotus 1-2-3 and other integrated business packages. The DOS Connector, which is available from Uniform Software Systems for the XT, works with PC/IX and XENIX. A version of the DOS Connector that works with VENIX/86 is available from UniSource. The latest DOS Connector release can operate with IBM's

Corporate Information Sharing. It's been described as the key to increasing a company's productivity. It's also why large networks of PC's are becoming more and more common in the workplace...in spite of the fact that they're costly, difficult to install, and incompatible with much existing software.

Finally, there's a solution to this corporate dilemma. Its name is LANLink™.

A Software-Driven LAN That Uses Standard, RS-232 Ports. A major breakthrough in local area networks, LANLink™ uses your computers' existing serial ports and runs under PC-DOS.

Because all of the intelligence the network requires is on the server and satellite diskettes, expensive network interface boards aren't required.

A Powerful Network That's Cost-Conscious. If you've been pricing board-driven LAN's, you already know that they can cost over \$1,000 per workstation. LANLink™ is different.

Boasting a data transfer rate in excess of 100,000 BPS, LANLink™ is compatible with a wide range of programs. And because special boards aren't required, installation costs are one-third that of a traditional network.

A Network Designed the Way Business Works. With LANLink™ you're able to customize your network along departmental lines using a data-sharing hierarchy and password-protected access.

Get Started With LANLink™ TODAY. Call The Software Link TODAY for complete details and the authorized dealer nearest you. The LANLink™ Starter Kit, priced at \$495, comes complete with network software for both a server and a satellite computer. For a limited time, 50 feet of RS-232 cable will be included free of charge.

LANLink™ is immediately available and comes with a money-back guarantee. VISA, MC, AMEX accepted.

TopView and runs on the AT. Lantech's uNETix, as noted earlier, includes a DOS emulator with similar capabilities as part of its basic package.

An alternative approach is to port the most popular DOS applications to UNIX. That is not a trivial task. Multi-user capabilities imply that only one user will have direct access to the PC's console. All other users will likely have remote terminals. Most of the programs of interest use some tricks under DOS to obtain instant screen updates that are not easily achieved under UNIX on a dial-up port running at 1200 baud, or even at much faster speeds. Also, many of the programs depend on the extra keys available on a PC keyboard that are not available on most video terminals. The result is some very awkward combinations of key sequences in order to simulate a simple function key press on the PC keyboard.

Another reason that DOS applications are not easily ported to UNIX has both technical and legal ramifications. Copy protection schemes employed in some top-selling programs are difficult to implement in a UNIX environment, and the concept of one user per copy of the program is impossible to enforce when programs are meant to be shared among many users. The usual response by the manufacturer is a contract or licensing agreement that pegs the price of the product to a maximum expected number of users or to a machine type.

Thus far, most suppliers of DOS applications have avoided the UNIX market, probably because it is currently perceived as too small to warrant a potentially difficult development effort. Microsoft is taking action that will positively affect the perception and growth of the UNIX market. Multiplan is available from SCO (see table 1) for XENIX on the XT and is available from other sources for many other UNIX systems. Other Microsoft products that have been known to DOS users for some time are beginning to show up in UNIX garb. This will help to ease the transition from DOS to UNIX for many users by providing some familiar software in the new environment.

Of course, DOS applications are not the only programs worth using. Several successful business applications for minicomputer and mainframe UNIX systems have been tailored to the PC UNIX market. SCO sells INFORMIX by Relational Database Systems for the PC, XT, AT, and most compatibles that can run XENIX (see table 1). INFORMIX is an excellent relational database management system that features forms-oriented

query and data entry, a general-purpose report writer, full audit trail capabilities, and interfaces to COBOL ISAM files and to C programs.

Another relational database management system for UNIX, Unify, is available from Unify Corporation. It is a full-featured DBMS that runs on the AT under XENIX, on the XT with the Sritek 68000 board and XENIX, and on XT and AT models running VENIX/86. The Unify

If a UNIX system is not brought down correctly, the file system may be damaged and files could be corrupted or lost altogether. This is due to the way in which UNIX buffers disk activity.

Corporation uses overlays of relatively small modules for each major task to run on systems with limited memory and to gain a claimed 40-percent speed improvement over most other UNIX-based DBMS products.

Another prime area of interest to business computer users is word processing. Integrated word processors, typified by WordStar and Microsoft's Word, have only recently started to show up on UNIX systems. The traditional UNIX approach has been to segregate the editing from the processing steps. Both types of systems are available to PC UNIX users.

In the integrated category, SCO sells Lyrix as an option for XENIX (see table 1). Lyrix has all of the expected features, such as full-screen editing, on-screen formatting, cut-and-paste operations, a mail merge facility, printer control and queuing, and interactions with the file system. It also has search (and replace), spelling checking, and a virtual terminal interface.

The Professional Writers' Package from Emerging Technology Consultants is an example of the divide-and-conquer approach. The package consists of EDIX, WORDIX, SPELLIX, and INDIX grouped together to operate from a main menu. AT&T announced at the Office Automation show in Atlanta this past winter that the Professional Writers' Package is available for its line of UNIX systems. Emerging Technology also makes the

product available on an OEM basis for use with other UNIX systems.

The point is that an important factor to consider when choosing systems and software is portability. Users want to be able to use the same editor, the same database manager, the same basic command set, the same everything on any computer they use in the course of their business. That is a goal that will never be achieved completely perhaps, but UNIX comes closer to it than any other computing environment.

UNIX systems generally tend to be large and complicated. A prime example of trouble caused by operator error can occur when the system is going to be turned off. If a UNIX system is not brought down correctly, the file system may be damaged and files could be lost or corrupted. This is due to the way UNIX buffers disk activity. With most UNIX systems, it is necessary to run a special shutdown program that flushes the buffers to disk and otherwise does an orderly exit.

Because of the complexity of UNIX, the importance of good vendor support cannot be overstated. The system supplier should be selected with the same care as for any other big ticket item. A lot of time and energy will be devoted to using UNIX, so the user should have a partner to help make it work right.

The most likely PC UNIX users are program development organizations in which cooperation among developers is essential. They will appreciate the ability to share and protect data simultaneously. Word-processing operations can benefit from the many useful tools that are provided with UNIX. Writers can put their prose to the test with Writer's Workbench or programs of a similar ilk that are found on most UNIX systems. Small businesses will find UNIX to be suitable for a wide range of tasks, from office helper to graphics preparer. It can even help with taxes.

Before anyone commits to a UNIX or UNIX-like system, a complete assessment of perceived needs and real requirements should be made. It should be obvious that if a user's sole purpose is to play with the flight simulator, he does not need UNIX. On the other hand, someone who is doing program development or documentation on almost any scale will be hard pressed to find a better operating environment.

Augie Hansen spent seven years with Bell Laboratories and AT&T before starting Omnware, a software development and training firm specializing in UNIX and MS-DOS systems and applications.

INTRODUCING 5

**WE INTERRUPT
PRODUCT
BRING**

THIS MAJOR INTRODUCTION TO YOU SOMETHING REALLY IMPORTANT.

THE BIG NEWS IN DISK/TAPE IS PC/T, A SENSIBLE NEW APPROACH TO ARCHIVAL STORAGE.

We've tamed tape. And made it docile. By making it DOS-like.

So, while this started as an ad for our five new HardFile™ subsystems, which deliver 25 to 80 megabytes of hard disk storage and 60 megabytes of tape backup, instead we want to introduce you to PC/T.™

PC/T is a new format that makes tape a more sensible storage solution for personal computers. It puts tape on line, in real time, for instant access. And frees your hard disk for your most current data.

You already know how to use PC/T. Because it responds to standard DOS commands.

Here's the big news: just like any DOS-controlled hard or floppy disk, PC/T enables you to create directories and files on tape. Then you can call up the exact file you need, and change a portion of the tape without having to erase and overwrite the entire cartridge.

Without PC/T, you have to rewrite the entire 60 MB cartridge each time you make a single change.

With PC/T, you create and directly access files on tape, just like with floppy or hard disk.

PC/T formats each new tape cartridge, just like you format any hard or floppy disk, locking out bad blocks to assure that every bit of data you write to tape is recorded with utter accuracy.

What's more, PC/T gives tape true error correction capability. 50% redundancy during write operations ensures 100% reconstruction of data lost because of operator error, dust and dirt, or everyday wear and tear.

There is a catch. You can get your hands on PC/T just one way: Buy one of our powerful new HardFile subsystems. With disk plus tape. Or tape alone. Which brings us back to where we started. And gives you a place to start. Just call 1-800-228-DISK for the Tallgrass dealer nearest you.

Building Device Drivers

*Routines and modules to help write
customized character device drivers*

STAN MITCHELL

Many system users, casual programmers, and hardware designers look upon the task of writing a device driver with something approaching dread, at least partially because the IBM documentation of device drivers and how they are written is minimal and includes few examples.

The most difficult part of writing a device driver is getting the framework right—knowing how to set it up so that DOS can install the driver and applications can use it. What this article offers is a generalized device driver “front end;” the more arcane tasks of creating the driver are given to a group of macros. This structure allows attention to be focused on the job at hand—how to control a device and tap its capabilities.

Before the details of device-driver construction can be discussed fully, the characteristics of devices, as the system views them, must be examined.

Exactly what is a DOS device, anyway? A device is simply a place to and from which bytes travel. Usually this place has a physical counterpart—a hardware peripheral of some kind—that is actually generating or using the bytes that are coming from or going to the device. A CRT is a device that receives bytes, as is a printer. A keyboard is a device that emits bytes, and so on.

Two types of devices exist: character and block. Character devices send or receive bytes one at a time. Block devices (which will not be discussed here) are generally disk drives or disk-

SOLVE PROGRAMMING PROBLEMS THE WAY YOU THINK. PURE AND SYMBOL.

APL★PLUS®/PC IS THE ANSWER.

The shortest distance between two points is a straight line. But unfortunately, that's not the case in programming.

Most languages require you to go through an enormous number of steps before an idea becomes reality.

That's why the APL★PLUS/PC System is such a dramatic and exciting software tool for serious PC programmers and application developers.

Instead of requiring you to learn—and write—long-winded and complicated programs, APL is based on your instinctive ability to deal in symbols. And once you begin using APL's quick notations, you'll find it the ideal programming

environment for all your application needs.

The incredible shortcuts you'll get with APL not only make you more productive, but make programming enjoyable. Intricate calculations and modeling on PC's are a snap. You'll spend less time on drudgery, and more time creating.

Only with APL★PLUS/PC, do you get:

- full-screen editing
- a built-in terminal emulator
- communications
- graphics primitives
- and report formatting.

Writing time-consuming programs like sorting, matrix inversions, and string searching is eliminated. APL's concise notation

already provides these...and more.

No wonder a *PC Magazine* reviewer enthusiastically reacted to our APL★PLUS/PC System with "awe and delight."

DEVICE DRIVERS

drive emulators, and they send or receive a block of bytes at a time; a block typically consists of a physical sector of the disk drive. For more details about block devices, see the *PC DOS Technical Reference* manual, which contains a sample block device driver in source form for a "ramdisk" program.

THE DEVICE CHAIN

Device drivers are programs created to control particular devices; DOS loads them at boot time. DOS creates a one-way linked list of system device drivers during the boot process. Each node in the list is an 18-byte data structure called a device header. The first four bytes of each device header comprise a 32-bit pointer in segment:offset form that points to the next node in the list.

The first node is embedded in IBMDOS.COM and corresponds to the NUL device, a "bit-bucket" device that absorbs everything sent to it and emits nothing. The last node is identified by a value of FFFFH in the offset portion of the 32-bit pointer to the next node.

The address of the first device header is found by opening the NUL device with DOS function 0FH using an FCB. DOS returns a pointer to the NUL device header in one of the reserved fields of the FCB. Links to succeeding headers are provided by the next device header pointer field.

Table 1 shows a sample device header chain. The contents of each device header have been presented in a more readable format than that provided by a raw dump in hexadecimal notation. Note that the Next Header field for each device becomes the starting address for the following device in the chain. Also note the FFFFH value in the offset part of the last Next Header field, indicating the end of the chain.

The format of a device header memory image is given in figure 1. The name and attribute words are user-selectable and reflect the function of the device. The attribute word is a bit map that indicates to DOS whether or not the driver has certain special properties, as explained below. Other entries are determined by driver placement in memory and by the system configuration. The strategy and interrupt fields are offsets into the segment begun by the first byte of the header.

The interface between DOS and devices was designed with multitasking in mind. The intent was to allow each device in a multitasking environment to maintain its own queue of requests for its services. The DOS executive would periodically scan its queue of pending

*Installed Devices

The NUL device's position at the root of the Device Header Chain prevents another NUL being loaded before it: NUL is the only device that cannot be preempted.

requests for completions and wake up waiting processes. A device request would call the strategy entry point, which would simply queue up the request in the form of a request header and return. Upon completion, a device would receive an interrupt and its service routine would post results in the corresponding request header. Before returning, the device would check again for waiting requests.

This capability has not been used in DOS versions 2.0, 2.1, or 3.0, none of which handles multitasking. Once a multitasking version of DOS is released, requests for device services almost certainly will be handled this way. In current DOS releases, the strategy entry point is used to pass a 32-bit pointer to a request block that is not queued. Next, an immediate call is made to the

interrupt entry point. Here the request is serviced, and results are passed back in the request block.

The strategy and interrupt entry points do not have an explicit segment in the device header. The segment address is given by the link pointer of the preceding device header. The segment portion of the address for the strategy and interrupt entry points is the same as the segment address of the header.

As mentioned earlier, devices are either character type or block type, depending on the way the driver deals with data. Figure 2 shows definitions of bit fields in the attribute word of a device header. If bit 15 = 1, the device is a character device; otherwise it is a block device. For character devices, the following bits are significant: IOCTL (bit 14), OCREM (bit 11), SPECIAL (bit 4),

DEVICE DRIVERS

CLOCK (bit 3), NUL (bit 2), STDOUT (bit 1), and STDIN (bit 0).

Bits 0-3 of the device's attribute word are flags that indicate to DOS whether the device is one of three devices treated specially by DOS. The NUL device has a unique device driver embedded in IBMDOS.COM and cannot be altered. The NUL bit is a flag that tells DOS that this driver is to be used for the NUL device. For a device that is to be used as the standard I/O device, the pair of bits STDOUT and STDIN are set. Similarly, the CLOCK bit is set on any device used as the clock device.

The other three bits of the attribute word are concerned with capabilities of the device driver. The SPECIAL bit (which is described in the MS-DOS *Programmer's Reference*) indicates that a standard I/O device driver has installed an INT 29H handler for output. This special handler is meant to provide fast output to the console. For the IBM PC, the IBMBIO CON device uses the write TTY function of INT 10H for fast console I/O and calls it through a short INT 29 service routine. The IOCTL bit indicates that the device driver supports input and/or output of control strings via DOS function 44H. The OCREM (Open/Close/REMoveable) bit became available with DOS version 3.0. This bit is described in DOS 3.0 documentation, however, a name has not been assigned to it. For a character device, it indicates that the device driver supports open and close functions. For a block device, it indicates that the driver supports removable media.

In the case of character devices, the name field of the device header is an array of eight ASCII characters, making up a legal file name. Instead of names, block devices are given unit numbers. For block devices, the first byte of the name field contains a count of the units supported by the driver, expressed in binary form. The rest of the name field is not used.

The default configuration of DOS does not allow a device and a file to share the same name. An undocumented CONFIG.SYS command removes this restriction but makes device references more verbose. To use this undocumented command (which is *not* available under DOS 3.0), add the line AVAILDEV=FALSE to the CONFIG.SYS file. Setting AVAILDEV to FALSE requires that all device references have the form \DEV\

allow the standard I/O device to be specified as either CON or \DEV\CON, but which would then forbid another file to have the name CON. Remember that when commands are undocumented, it is usually for a reason.

One of the advantages of MS-DOS over the earlier CP/M operating system is the relative ease with which the Basic I/O System (BIOS) can be extended, allowing users to install devices without rewriting the BIOS.

For the IBM PC family, the BIOS resides in IBMBIO.COM. The device header chain in table 1 is based on the resident BIOS provided by DOS 3.0. The devices provided for are the same as in versions 2.0 and 2.1. Besides NUL, which is always present, MS-DOS requires a minimum of four devices in the system-initialization code. These devices are those that follow NUL in table 1: CON, AUX, PRN, and CLOCK\$. The device names are unimportant, but the function each performs must correspond to the following sequence: standard I/O device, auxiliary I/O device, listing device, and the realtime clock.

After these four devices have been installed, additional resident devices are installed. These resident devices are used to initialize DOS. When installation is complete, an attempt is made to open CONFIG.SYS on the boot drive. If CONFIG.SYS exists, it is read into a buffer and the contents are parsed into commands.

The command line for adding a device is as follows:

```
DEVICE=[d:][path]filename[.ext]
[parameters]
```

For example, the command

```
DEVICE=c:\util\logcon.sys /L
```

could be used.

The items in square brackets are optional and include drive and path specifiers as well as a parameter field following the file name. A pointer to the command line following the equal sign is passed to the device driver when initialization code is first called as the devices are installed. The driver can parse and make use of any parameters. Device files are binary memory images

that do not use the Program Segment Prefix; thus, they are ORGed at 0000H.

When a new device is installed, it is added to the linked list at the link immediately following the NUL device. This addition is done in two operations: first, the Next Header pointer in the NUL device header is moved into the Next Header field of the device header to be installed; second, the Next Header field in the NUL device is replaced with the segment:offset address of the newly installed device header and driver. New drivers are thus added to the linked list at the root (NUL), pushing previously-installed drivers farther down the list.

Installed device drivers get the lowest DOS memory allocation. COMMAND.COM loads in above them, as do any "terminate and stay resident" programs. Consequently, if an application requires memory in the first 64KB (DMA channel 1, for instance), a device driver could be used to reserve a buffer in the lowest available RAM.

Before DOS can access a device, that device must be opened using function call 0FH or 3DH. If a device is opened with function 0FH, it can be read from and written to with DOS functions 14H and 15H. If function 3DH is used, a 16-bit file handle that is associated with the device is returned. Input, output, and I/O control functions that work with a file handle require that the device be opened with DOS function 3DH rather than function 0FH.

Before the CONFIG.SYS file is parsed, the standard I/O devices are opened on return from the initialization call to DOS. DOS function calls 01H through 0CH are therefore available at this time, using the default resident drivers. File operations are not recommended at this time, however, because DOS is in the process of setting up its buffers. Memory allocation calls are also off limits, because the current allocation is still growing to incorporate the configuration parameters specified in CONFIG.SYS. One DOS function that is safe to use (and that may be useful when a device driver is initialized) is 30H, which returns the DOS version number.

Remembering which DOS calls are valid during this phase of the boot process is important, because as each device driver is installed, a portion of it is executed. The device initialization code primes the device so that it will be in a predictable state on the first input, output, or other DOS request. The initialization code also tells the device-installation routine which portions of the device-driver file should be kept after the initialization is complete and which

should be thrown away. Throwing away part of this file saves space and can be done because initialization code usually needs to be executed only once.

Once the CONFIG.SYS file has been completely parsed, all of the initial standard device handles are closed and then reopened so that user-installed device drivers can preempt the default drivers for CON, AUX, and PRN. When a device handle is opened, the first device in the linked list that matches its name is used to satisfy the request. This allows duplicate device names to be included in the CONFIG.SYS file for CON, AUX, and PRN.

Because installed devices are inserted immediately after the head of the

chain, a user-installed CON, AUX, or PRN device driver will be found before the DOS-supplied default drivers for these devices. Note that the position of the NUL device prevents another NUL being loaded before it. NUL is thus the only device that cannot be preempted. Table 2 shows a device header chain containing two user-installed devices.

CXI is now compatible with what's-her-name.

That's good to know.

It means the CXI 3278/79 PLUS coaxial connection is now 100 percent compatible with IRMA.[™] So you can add our new hardware to your network and run all the same software she runs. Without changing a thing.

Not your mainframe application software. Not your PC software. Not even old what's-her-name.

So if nothing changes, why go with CXI? Simple.

Our CXI 3278/79 PLUS emulator

gives you more to work with. You get one host session, one PC DOS session and two notepads. All on the same screen at the same time. No toggling back and forth between sessions. And no wasted effort whatsoever.

We're easy to connect, too. Just slip our 5-inch board into any available slot—even a short one—on your IBM[®] PC, XT, AT or compatible. Attach the coaxial cable to a 3274/76 cluster controller. And start sharing information direct with your mainframe.

You should know, too, all our products are now soft-loaded. Not PROM-based like IRMA. So when it comes time to upgrade, you simply insert a new floppy. Instead of new PROMs.

And that goes for our new 3278/79 STANDARD connection as well. It's feature-for-feature identical to IRMA. Except for one thing.

It costs up to \$300 less.

consists of a selection of attribute bit fields that are ORed together to form a single word.

The printer driver is a character device (bit 15 = 1) that supports I/O control strings (bit 14 = 1); when these two bits are ORed together, they produce the attribute word C000H. The device name (here, a replacement for default driver PRN) is the ASCII string PRN plus blanks to bring it up to eight bytes. The macro MKNAME takes the label entered in DD_DEF.MAC and converts it to a series of eight constants, N1 through N8. This was done to localize editing to a single file.

The other three entries in the device header are labels of data structures or executable code. NEXT0 is the offset to the next device header in this file. Because only one device is defined in this device file, the value -1 is used to

indicate that it is the last device header in this device file. STRAT_ENT and INT_ENT are labels for the strategy and interrupt entry points in the module ENTRY.ASM (listing 3).

The Entry Points. The strategy entry point in ENTRY.ASM, STRAT_ENT, takes a 32-bit pointer passed to it by DOS in ES:BX and stores it. This is a pointer to a request header. The first 13 bytes of a request header use the standard format shown in figure 3. Additional bytes may be appended to the structure for certain types of function calls.

The interrupt entry point in ENTRY.ASM, INT_ENT, is called immediately after DOS has returned from the strategy entry. The interrupt routine preserves the state of the caller by means of the series of PUSH and POP instructions at the entrance and exit of the routine. Three pieces of information

are extracted from the request header: the function code, the byte count, and the transfer-buffer address.

If the function code exceeds the highest valid function code for the selected DOS version, an error return is made. If the selected function code is valid, it is doubled and added to the base of the function entry point table in order to get the address at which execution will continue. The byte count and transfer buffer address are used to pass data back and forth between the driver and the calling logic.

Before control is returned to DOS, all calls to the interrupt code must set appropriate bits in the status word of the request header. If an error return is made, an error code must also be included in the returned status. The format of the status word is shown in figure 4. Many of the defined error codes

also apply to block devices. Those that could be used for character devices are found in listing 4, REQHDR.MAC.

The Function Table. Valid function codes range from 0 to 12 for DOS 2.0 and 2.1 and from 0 to 15 for DOS 3.0. The function table contains as many entries as there are function codes. Each entry is the offset address in the code segment to the routine that performs the function requirements.

The entries in the function table of listing 5 are aliases for the actual labels that mark the entry points for the functions in external modules. The macro FUNCTION is used in the device-definition file DD_DEF.MAC to set up the function table. The macro takes the alias label (for example, .INIT) and equates it to the user-defined entry point for the function. If the function is not implemented, any of the labels DONE, INVALID, or DONE2 in ENTRY.ASM could be used as entry points. If the function is implemented, the entry point label is assumed to be external.

If multiple devices are defined in a single file, it may be necessary to create

separate function tables for each device. Furthermore, the interrupt entry points in the device headers will have to point to separate set-up code.

Character Driver Function Codes. There are 16 function codes that may be passed to a device driver under DOS 3.0 and 13 under DOS 2.0 and 2.1. Each function code specifies a separate command. In the following descriptions, the names of the commands (for example, .INIT) are labels from the module FUNTBL.ASM. Data placement in the request header is described in terms of offsets that are defined in module REQHDR.MAC.

.INIT (code 0) executes initialization code at installation time. The ending address of the loaded code and/or buffer area that is to remain resident is set by .INIT at offset BRKOFF in the request header. If multiple devices are installed in a single file, the .INIT code for the last device sets the ending address of what will remain resident of the file. DOS does .INIT calls only at installation time, so .INIT code can be discarded by setting the ending address of resident code to .INIT - 1.

Upon entry to .INIT, the 32-bit pointer at offset PARM in the request header points to the ASCII string command line from the DEVICE= command in CONFIG.SYS that installed the device. The command line includes everything that follows the equal sign in the command; it will always include the file name of the installed device driver. A parameter field also may be present after the file name. To determine whether a parameter field is present, scan the command-line string for the first carriage return or line feed. If a line feed is encountered first, no parameter field is present. If a carriage return is encountered first, a parameter field is present and the pointer points one character beyond the end of it.

.IOCTL_IN (code 3), .INPUT (code 4), .OUTPUT (code 8), .VOUTPUT (code 9), and .IOCTL_OUT (code 12) provide actual input and output for the driver. They all use the byte count at offset CNT and the transfer-buffer address at offset BUF in the request header for passing data during the transaction. On return, the actual number of bytes

transferred is posted at offset CNT in the request header. Note that .INPUT, .OUTPUT, and .VOUTPUT deal with the transfer of data on the device channel, whereas .IOCTL_IN and .IOCTL_OUT deal with the transfer of control information to and from the device driver.

.ND_INPUT (code 5) provides non-destructive input without making the calling logic wait. On return, the BUSY bit in the status word is 0 if a character is available in the device buffer and 1 if no character is available. If a character is available, a copy of it is placed in the request block at the offset PRECHAR.

.IN_STAT (code 6) returns status concerning the availability of data on the next read from a character device. Again, the driver sets the BUSY bit in the status word to 0 if data is available and to 1 if no data is available. If the device does not buffer data it should always return the BUSY bit as 0.

.OUT_STAT (code 10) returns a status concerning the device's ability to accept data writes. If the device is busy with a current write request and an .OUTPUT call would be forced to wait, the BUSY bit is set to 1 on return. If the device is available and would act immediately on an output request, the BUSY bit is cleared to 0 on return.

.FLUSHIN (code 7) and .FLUSHOUT (code 11) essentially clear active requests on a device. The device input or output buffer is cleared.

.OPEN (code 13) allows a device to receive initialization or set-up commands at the beginning of an I/O stream. At the end of the I/O stream, the device can be restored to a default set-up or some form of command termination or sign-off can be sent to the device via .CLOSE (code 14).

Functions that a device driver does not support are handled in several ways. For those calls that are unique to block devices, a character device can simply set the DONE bit in the status word and return (that is, exit through DONE in ENTRY.ASM). Even if the device does not support I/O control input strings, nothing prevents calls via DOS function 44H to perform such requests. The appropriate action in this case is to post 0 bytes transferred at offset CNT in the request header, set up the error status and the error code for an unknown command, and then exit. Exiting can be accomplished by transferring control to INVALID in ENTRY.ASM.

If the device does not support I/O control output strings, it is sufficient to exit through DONE in ENTRY.ASM. In this case, the transfer request is to the device driver and the response has the

net effect of receiving the control string but not acting on it. Input and output status requests can also be handled by exiting through DONE in ENTRY.ASM. Note that this has the side effect of always returning BUSY as 0.

Three other exit points can be used in order to return from functions. DONE2 sets the DONE and BUSY bits on return from a status function. XFER sets the DONE bit and updates the byte

Device drivers are difficult to debug because once loaded, they are not easily accessed. Bugs in .INIT code can be especially troublesome because they can prevent the system from booting.

count at offset CNT in the request header by subtracting CX from it. ERROUT sets the DONE and ERROR bits in the status word and uses the contents of AL as an error code.

Special Considerations. Roughly speaking, if a function module is complicated and requires nested calls to several procedures, it is wise to define a local stack on entry into the module. .INIT code is especially touchy in this regard; it also has other restrictions, which were discussed earlier in this article.

PREPARING A DEVICE DRIVER

Listing 6, MAKE_DD.ASM, contains a number of include files that together provide a generalized front end for any kind of character device driver. The primary include files are DD_MAC.MAC, FUNTBL.ASM, and ENTRY.ASM. The other files contain equates or macros.

Some Rules. MAKE_DD.OBJ is linked with one or more additional modules that implement the driver functions. Listing 7, PRNMOD.ASM, is an example of such a function module file. User-defined function modules must observe two rules. First, they must use the same code segment declaration that is used at the beginning of MAKE_DD.ASM; second, the externals declared in MAKE_DD.ASM must be satisfied by public declarations in the collection of function modules.

Editing the Device Definition File. Setting up MAKE_DD.ASM for a particular de-

vice driver application requires editing only of the file DD_DEF.MAC. The DOS version under which the driver will be used must be specified using an equate: set DOS2_X TRUE for pre-DOS 3.0 and FALSE for DOS 3.0. Set MKNAME to the name of the device driver. The attribute word must be created by making a list of all the bit names that are to be set, separated by the logical OR operator, +. This process ORs together all the named bit constants that were selected and places the resulting value in ATTRIB. Finally, the FUNCTION macro is invoked once for each entry in the function table. If a function is not implemented, the macro takes the following form:

```
FUNCTION FALSE,<function name>,<exit point>
```

This macro requires that the exit point be defined in ENTRY.ASM.

Batch Mechanics. Once the function modules have been written and MAKE_DD.ASM has been edited, all that remains to be done is to assemble the program, link it, and convert it to a .COM file. The following batch file handles these steps for the example listing:

```
MASM MAKE_DD;
MASM PRNMOD;
LINK MAKE_DD+PRNMOD,PRNDEV;
EXE2BIN PRNDEV.EXE PRNDEV.SYS
```

The link operation will generate a "no stack segment" error, which may be ignored. The LINK command line instructs the linker to produce the file PRNDEV.EXE. In PRNDEV.EXE the device header and the code that follows the header are at an offset of 100H from the beginning of the binary image when the file is loaded. EXE2BIN forces this image into the .COM format, which places the image at an origin of 0000H. The file extension on the output code file written by EXE2BIN has been set to .SYS rather than .COM to indicate that the file is a device driver. To load the new device driver, it is necessary to include the command line

```
device=prndev.sys
```

in the CONFIG.SYS file of the boot drive and then reboot the system.

Some Testing Methodologies. Device drivers are difficult to debug because once loaded, they are not easily accessed. Bugs in .INIT code can be especially troublesome because they can prevent the system from booting. Unless some rather sophisticated debugging tools are available, the safest approach is to start with something that is known to be free of bugs, then add to it in increments.

DSC Introduces AT capabilities IBM isn't telling you about.

With DSC COM boards, your AT can support 16 users. Not just 3.

With DSC COM boards and the XENIX operating system, your AT can support up to 16 users. *For about 1/3 the cost of networking.* COM boards save you the cost of networking hardware by adding multiple, individually addressable serial communication ports. And the multitasking, multiuser processing power built into your AT saves you the cost of a "smart" terminal for each user.

COM-4 adds 4 individually addressable serial communication ports. COM-8 adds 8 ports. And a pair of COM-8 boards

brings your AT up to the full capability IBM isn't telling you about: 16 users, not just 3.

*Why isn't IBM talking?
They're probably just being nice
to the competition.*

For example, use MAKE_DD.ASM with all functions except .INIT exiting through DONE. Within .INIT, perform the minimum requirements of the function—that is, specify the ending address of the driver. If the new device is intended to replace one of the standard devices, the bits in the attribute words for STDIN, STDOUT, and CLOCK should not be set yet and none of the reserved device names should be used; if a reserved device name is used, DOS will open a handle for the device and call it during boot time. An incomplete or malfunctioning driver must *not* replace a necessary standard device, such as the system console.

The lack of standardization of printer-control codes and the great variety of printer capabilities make printer drivers an important bread-and-butter item of systems software consultants.

Now create a loadable device driver, insert an appropriate command line in the CONFIG.SYS file, and reboot the system. At this point the "empty driver" is loaded; its location in memory can be determined by opening an FCB for the device name. The sample DEBUG session that is shown in figure 5 illustrates the method. From the header, according to this figure, the strategy entry point is 085F:0036 and the interrupt entry point is 085F:0041. A standard FCB was used in this case and the offset to the device header pointer depends upon the DOS version. DOS 3.0 is shown in the example. The offset for DOS 2.X is 19H from the beginning of the FCB buffer.

The safe way to proceed would be to add the function modules at this point, reload the device driver, and test each function by direct calls. For example, to test the .IOCTL_IN function in PRNMOD.ASM, the debug session might proceed as shown in figure 6.

.INIT code can be traced cheaply using some HEX dump routines that display contents of memory locations or registers at the console. During the debug stages, use a local stack to prevent crashes caused by clobbering the stack

of IBMBIO's device-installation routine. Envelop the trace routines and calls in conditional assembly brackets:

```
if DEBUG
mov ax,bx
call DISP16
endif
```

so that changing a single equate pulls all of the trace stuff out.

A device can be accessed from within an applications program in two ways: The preferred method is to make a DOS call that in turn sets up one or more appropriate request headers and strategy and interrupt calls. The other method, sometimes used as a debugging aid, is to make a request header and call the device driver directly. The latter method requires the program to provide the error-handling routines that DOS provides if system calls are used. It has the advantage, however, of giving more direct control of a device and providing the possibility of using the .INIT function (assuming it is resident) for purposes other than installation.

If the DOS interface is used, it is necessary to open an FCB or file handle for any device other than the standard I/O devices. For example, the code segment that is reproduced in figure 7 implements the essence of the CTTY function of COMMAND.COM, which permits reassignment of the standard console to another device.

Figures 8 and 9 illustrate the use of I/O control strings in setting or interrogating a device, in this case the PRN device developed as an example driver. The call in figure 8 sets the serial channel for baud, parity, stopbits, and databits. The HEX value written is used as the channel initialization byte. The call in figure 9 reads the last channel initialization byte used to configure the port.

These IOCTL examples are based on a simple device driver. A more useful driver would include selectable escape sequences for setting various kinds of forms, character fonts, and graphics modes. The lack of standardization of printer-control codes and the great variety of printer capabilities make printer drivers an important bread-and-butter item of systems software consultants. The "boilerplate" character driver presented in this article should make it easier to get a piece of that action—or at least it will be enough to force that old Diablo in the corner to get on speaking terms with your PC.

GROWING OLD?

...waiting for C programs to compile and link?

Use **C-terp**
the complete C interpreter

This is the product you've been waiting (and waiting) for!

Increase your productivity and avoid agonizing waits. Get instant feedback of your C programs for debugging and rapid prototyping. Then use your compiler for what it does best...compiling efficient code ...slowly.

C-terp Features

- Full K&R C (no compromises)
- Complete built-in screen editor--no half-way house, this editor has everything you need such as multi-files, inter-file move and copy, global searching, auto-indent, tab control, and much more.
- Fast--Linking and semi-compilation are breath-takingly fast. (From edit to run completion in a fraction of a second for small programs.)
- Convenient--Compiling and running are only a key-stroke or two away. Errors direct you back to the editor with the cursor set to the trouble spot.
- Compiler Compatible--You can access functions and externals compiled with C86 or Lattice C or assembly language. Utilize your existing libraries unchanged!
- Complete Multiple Module Support--Instant global searches, auto-compile everything that's changed, etc.
- Many more features including batch mode and symbolic debugging.
- Runs on IBM PC, DOS 2.x, 192K and up
- **Price: \$300.00 (Demo \$45.00) MC, VISA**

Ashton-Tate Pulls 'Multi-User dBASE II' From U.S., Canada Because of Poor Sales

CULVER CITY, CA—Poor sales have forced Ashton-Tate to discontinue the multiuser version of *dBASE II* in the United States and Canada, according to a company spokesman.

The move appears to be a blow to 3Com, makers of the only network on which *Multi-User dBASE II* now runs. The Ashton-Tate spokesman's comments seemed clearly to indicate that *Multi-User dBASE III*, due this spring, will not run on the 3C

BUSBOARD™ SAVES TIME

In the vertical market world, the name of the game is getting your PC based product to market in less time and for less money. Busboard is modular which makes product development easier. If the design needs to be changed, just change a module. And since Busboard is modular, you never pay for features you don't need.

Since your product may change over time, Busboard allows changes in board configuration without requiring radical new software and hardware development.

3 Busboards to Choose From!

- **Busboard** - Socketed for up to 512K of memory in 64K increments. Up to 8 Busmodules may be added without using more than one slot in an IBM PC.
- **Busboard MPC** - A packaged combination of the Busboard with a Clock Calendar Module is the perfect add-on for PC's with a serial or parallel port already built-in.
- **I/O Busboard** - A low-cost board with the ability to add up to 8 modules. Also features a bread-board area for your own circuits.

More Modules For Greater Design Flexibility

Asynchronous Communication Module - This module can be configured as Com1, Com2 or with the Busboard Multicom software as Com 3-14. Features straps for modem control handshaking, interrupt level and interrupt status. Cabling options include DB25, DB37 and RJ45.

Parallel Printer Interface - Provides an IBM compatible Printer Interface which can be configured for LPT1, LPT2 or LPT3.

Modules front and back

Clock Calendar - Provides a crystal controlled chronograph which provides the accurate time and date each time the computer is powered up. Includes clock set software.

300 Baud Auto-Answer Auto-Dial Modem - Features auto-answer and auto-dial in tone or pulse. Ideal for remote diagnostics requiring reliable low speed communications. Supplied with a complete communications program, requires an Async Module listed above.

Monochrome Display Adapter - A complete IBM compatible Monochrome Display controller on a module. A version for low cost composite video monitors is also available.

24 Bit I/O Module - 8255 PPI based module provides 24 bits of binary control inputs or outputs. Features selectable address decoding, external cable configuration, and half the board is available for prototyping.

Would you hire an entire band when all you need is one instrument? Of course not.

So why use a whole orchestra of computers when all you need is one to develop software for virtually any type of micro-processor?

The secret? Avocet's family of cross-assemblers. With Avocet cross-assemblers you can develop software for practically every kind of processor — *without having to switch to another development system along the way!*

Cross-Assemblers to Beat the Band!

Development Tools That Work

Avocet cross-assemblers are fast, reliable and user-proven in over 4 years of actual use. Ask NASA, IBM, Xerox or the hundreds of other organizations that use them. Every time you see a new micro-processor-based product, there's a good chance it was developed with Avocet cross-assemblers.

Avocet cross-assemblers are easy to use. They run on almost any personal computer and process assembly language for the most popular microprocessor families.

Your Computer Can Be A Complete Development System

Avocet has the tools you need to enter and assemble your soft-ware and finally cast it in EPROM:

VEDIT Text Editor makes source code entry a snap. Full-screen editing plus a TECO-like command mode for advanced tasks. Easy installation - INSTALL program supports over 40 terminals and personal computers. Customizable keyboard layout. CP/M-80, CP/M-86, MSDOS, PC DOS. \$150

EPROM Programmers let you program, verify, compare, read, display EPROMS but cost less because they communicate through your personal computer or terminal. No personality modules! On-board intelligence provides menu-based setup for 34 different EPROMS, EEPROMS and MPUs (40-pin devices require socket adaptors). Self-contained unit with internal power supply, RS-232 interface, Textool ZIF socket. Driver software (sold separately) gives you access to all programmer features through your computer, lets you download cross-assembler output files, copy EPROM to disk.

Model 7228 Advanced Programmer — Supports all PROM types listed. Superfast "adaptive" programming algorithm programs 2764 in 1.1 minutes.

Model 7128 Standard Programmer — Lower-cost version of 7228. Supports all PROM types except "A" versions of 2764 and 27128. Standard programming algorithm programs 2764 in 6.8 minutes.

Alloy takes your PC to the limit.

QICSTOR-PLUS. The ultimate in PC expansion with five IBM compatible slots, hard disk storage, and streaming tape backup in one neat package.

Alloy's QICSTOR-PLUS meets all your expansion needs. It's the ideal upgrade for a growing PC or AT system.

QICSTOR-PLUS has five full size expansion slots which are completely compatible with the IBM PC bus and they also support Alloy's PC-SLAVE/16 multi-processor, multi-user capability. Its high performance hard disk has a capac-

ity of 36 to 128 MBytes. And QICSTOR-PLUS has file-oriented streaming tape backup with a formatted capacity of over 50 MBytes. Alloy provides file-oriented QTIP software with a transfer rate of 2 MBytes/minute.

QICSTOR-PLUS is available right now. So call Alloy today at (617) 875-6100.

Introducing a complete internal half- high 60 megabyte tape backup system for your IBM® PC, XT, \$995 or AT for only

Complete with tape drive, controller, and software

And it works easily with all IBM compatible operating systems. Simply tell your tape drive you want to backup or restore the entire hard disk, or any file, or backup or restore by subdirectory, date, or everything since you last backed up.

Now you won't have to wait for the difficult to find hard-disk version of the IBM AT (model 99). You can buy the floppy disk IBM AT (model 68), add our hard disk and tape drive system for about what you'd pay for the AT hard disk upgrade alone. It's almost like getting the tape drive free.

Let's face it, we've all heard the horror stories of people who've lost data on their hard disk. True, it doesn't happen often, but then disaster seldom does. With the amount of data you can put on a hard disk these days, no one in business can afford even a small disaster.

When did you last backup your hard disk?

Oh, you did it once with floppies

and it was so time consuming that now you've convinced yourself nothing will go wrong? In other words, it can't happen to you. And besides, at the prices they're asking for tape backup—\$2,000 and up—you're willing to take a chance. You've seen some tape drives for less, but you have to buy an expensive hard disk to go with it, and you've already got a good hard disk. Where can you turn for relief?

IBM Compatible tape drive system complete for \$995

The Express Systems™ tape drive comes complete—half-high tape drive, controller, and software—for only \$995. It's absolutely IBM compatible—all 60 megabytes of it.

You can use your tape drive in the event your hard disk fails. And if you have to replace your hard disk, the tape's ability to read bad sectors will let you replace your hard disk with another even if the new one is not error-free. The tape requires very low power, too.

And it doesn't poke along. It reads and writes at 90 inches per second (ips) and transfers data at up to 3.75 megabytes per minute in the streaming mode. You don't have to be a rocket scientist to figure that you can perform an image backup of a 20 megabyte hard disk in about 5 minutes. But practically speaking, once you back up your hard disk completely for the first time, you never need to do more than invoke the archive command—that convenient command that tells your new tape drive to backup everything since you last backed up. If you back-up as often as you should, your Express Systems tape drive will finish the job virtually in seconds.

The Express Systems software has additional benefits, like enabling you to use PC DOS terminology such as "*", "**", and "?". It also has a built-in reformatter, built-in verification (to make sure you transferred what you thought you did), and it's prompt driven, which means it asks you exactly what you want to do.

Easy to install

Before you get intimidated about installing our tape drive internally, you should understand that IBM doesn't think it's too difficult. They're selling IBM PC ATs with instructions on how to add additional hard disks in the *Installation and Setup* manual that comes with the AT.

The IBM AT installation manual shows how easily you can install internal storage drives yourself.

Our instructions for installing your new Express Systems tape drive follow IBM's clear, simple instructions.

We even provide the tape cartridge

Most people don't realize that the tape cartridge contains most of the critical mechanisms to insure data integrity. In order to be sure that you get the best insurance for your data (after all, isn't that why you're buying it), we encourage you to use Express Systems' specially tested tape cartridges. We're not going to kid you and tell you others won't work, but here's what's special about Express Systems tape cartridges.

First, they are tested down four separate tracks from end-to-end, not just down the center of the first 150 feet, like some others do. We use three screws to hold the cover on instead of four. This simple triangular arrangement keeps the base plate flat, just like three legs work better than four to make a table steady. Since all tape drives reference everything to the base plate, this alignment is critical. We also use special rollers to dissipate possible static electricity buildup—something that can ruin your whole day.

The Express Systems tape drives come with Express Certified™ 555 or 600 1/4-inch tape cartridges with quadruple end-to-end testing for extra insurance of your data.

And finally, we will sell you tape cartridges in boxes of three instead of the usual five. So, you get higher quality with a smaller quantity commitment. And we compound the savings with a lower per unit price, just \$35.00 instead of the usual \$45.00 most retailers charge.

Need a hard disk?

Depending on whether you have an IBM PC, XT, or AT you may want additional hard disk storage. We have those too. We offer 10, 21 and 31 megabytes of formatted hard disk storage.

For the most part, our drives are made with plated media,

which means there is less chance to damage them.

(Let's face it, the oxide that most disks come with is nothing more than rust.) We then test the drives, pre-format

them, and install DOS 3.0 so that you're ready to begin transferring files. We even include DOS 3.0 documentation.

And they're 100 percent IBM compatible. The controller we send you for the XT is an upgraded version of the XT controller from the same company that makes the XT controller. In fact, the Express Systems controller is an improved controller which requires less power so that it is more reliable than any other standard controller.

We provide the power too.

If you want to upgrade your IBM PC, there just isn't any way around upgrading your power supply—if you want to have true XT or better capability. Some companies say that their hard disks don't require any increase in power—and they might be right. But don't add anything to your slots, because the minute you do, you'll need more power. That's the bad news.

The good news is that our power supplies are inexpensive. How's \$99.50 for an XT power supply? We mean a full 130 watts of power. The other good

Our 130 watt power will convert your PC to XT standards; and it's only \$99.50 with any tape drive or hard disk order.

news is that it's held in by only 4 screws. Express Systems' power supplies can be changed in 20 minutes, a small price in time for the peace of mind to convert your PC to an XT-capable machine and avoid the unsightly "wart-like" power supply add-ons that some companies insist you paste on the back of your PC.

But from a mail order house?

We get tired of the snide remarks some people make about mail order houses. The comments are usually spread by distributors and retailers who are getting cut out of 15 and 35 percent margins, respectively. If we went through distribution—you'd have the privilege of paying for large glass windows, rugs, salesmen, etc.—but we'd also be selling this tape drive for \$1495.

We're not criticizing distributors and retailers. They perform a valuable service. But you don't need them if you know what you want. And you can

certainly install it yourself. IBM has proved it with their instructions for self-installation that come with the new IBM PC AT.

And speaking of IBM, the next time you hear anyone criticize mail order as a way to buy computer equipment, remind them that IBM is now in the mail order business.

Warranty

We offer you a one year warranty on our hard disks—the same as IBM on the AT and 90 days on the tape drives. (It's all the manufacturer gives us.) If anything goes wrong with your tape or disk drive or hard disk, send it back in the box it came in. However, we have found that we can usually solve the problem over the phone. So call first for a return authorization number because we can't accept any returns without it.

Immediate delivery

We have four types of delivery: *Next Flight Out*™ if you need it immediately; *Next Day Express*™ and *Day After Tomorrow*™ if you can wait a day or two; and our normal delivery—which we pay—if you can wait a few days.

Not long ago, *PC Magazine* called MDBS III "The most complete and flexible data base management system available for microcomputers." That's a powerful statement. But then, MDBS III is an amazingly powerful software package. So powerful, in fact, that it lets you build mainframe-quality application systems on your micro or mini. MDBS III is not for beginners. It's for application developers with large data bases or complex data interrelationships who want to define data base structures in the most natural way—without resorting to redundancy or artificial constructs. It's for professionals who can appreciate its extensive data security and integrity features, transaction logging, ad hoc query and report writing capability and its ability to serve multiple simultaneous users. And if you want the power and the glory that only the world's most advanced data management system can provide, MDBS III is for you. For information on MDBS III and our professional consulting services, write or call Micro Data Base Systems, Inc., MDBS/Application Development Products, 85 West Algonquin Road, Suite 400, Arlington Heights, IL 60005. Joystick Metrics

*Measuring physical properties
through the PC's joystick port*

MICHAEL A. COVINGTON

The IBM PC is put to some of its most interesting applications when it is asked to handle data on and respond to external physical conditions. Microcomputers can serve in many such capacities: as superintelligent thermostats for heating systems, data collection devices for the laboratory, or automated troubleshooters for electronic equipment.

In addition, unlike other kinds of measuring equipment, the computer can store and analyze large amounts of data automatically.

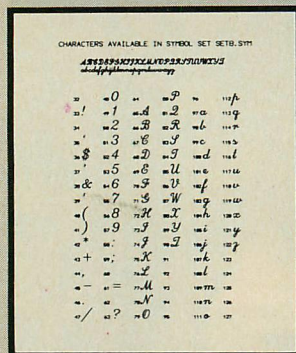

Almost all of these applications require some form of analog-to-digital conversion—that is, a continuously varying quantity, such as a voltage, has to be converted into computer-readable form. Commercial analog-

to-digital converters often cost hundreds of dollars, but the PC's joystick port (officially called the IBM Game Control Adapter) can be used to do the same job in a simpler way. The circuits discussed in this article can convert the joystick port into a device that will measure resistance, capacitance, or voltage. No modification to the PC or the adapt-

PLOTCALL is a graphics system that processes standard plotter instructions into a form that can be printed on over 20 dot matrix printers. This is not another print screen program; presentation quality graphics are created directly on the printer to achieve the maximum resolution possible. (120 x 216 dots per inch for Epson printers)

PLOTCALL includes 17 symbol sets for sign making and plot labeling. Symbol sets may be altered, or create your own! Character strings may be created from any symbol set, rotated to any angle, and scaled to any size.

Plots can be created from any language or from digitized data. An interactive plot debugging program allows you to preview a plot on the screen before sending it to the printer.

All plots in this ad were created with **PLOTCALL** on an Epson printer. No ad-

ditional hardware is required, not even the color graphics card!

Also included are the following easy to use, interactive programs that utilize the **PLOTCALL** system:

SURF creates high resolution three dimensional surface plots with hidden line removal.

TOPO creates contour maps using the same data as **SURF**. **TOPO** uses the character routines in the **PLOTCALL** system to provide inline contour labels.

GRAFIT creates charts and graphs of all types - XY graphs, bar charts, pie charts, and line graphs.

IBM PC or compatible with a minimum of 128K of memory and a dot matrix printer with graphics option are required.

er is required: the circuits all plug in externally in place of the joystick.

These circuits have not been tested with the PCjr, but they should be fully compatible with it. The PCjr *BASIC* and *Technical Reference* manuals indicate that, with the exception of the pin connections, the PCjr's built-in joystick port is identical to the PC Game Control Adapter. Performance with PC compatibles is hard to predict, but if IBM's Game Control Adapter card can be used in the computer, chances are good for full compatibility in this area.

An IBM PC joystick consists of two potentiometers at right angles to each other, plus two firebuttons; for simplicity, only the potentiometers will be considered here. The computer senses the position of the joystick by measuring the resistance of each potentiometer, which varies from 0 to 100,000 ohms. This is done by timing how long it takes a capacitor of known value to charge through the unknown resistance.

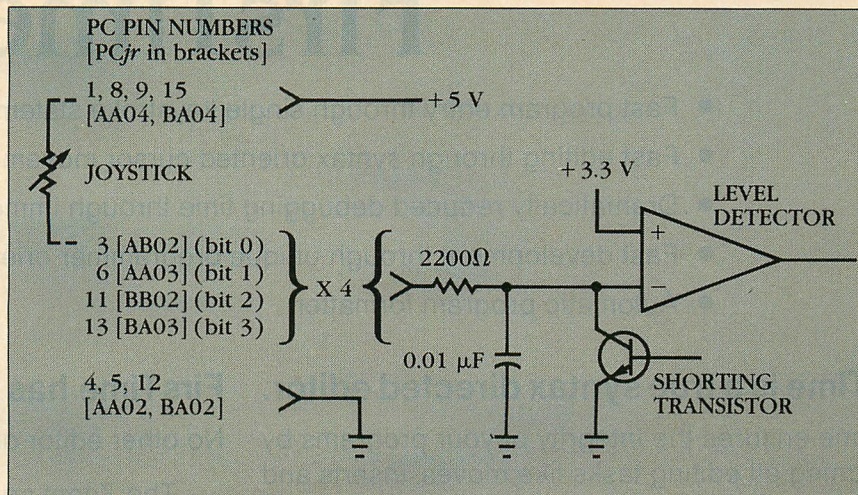

Figure 1 shows a simplified version of the circuitry inside the joystick port; figure 2 shows the pin connections. One end of the resistance to be measured is connected to the positive 5-volt supply; the other end is connected, through a 2200-ohm resistor, to the capacitor. Normally, a switching transistor keeps a short circuit across the capacitor to prevent it from charging; the PC reads the joystick position by removing the short circuit and timing how long it takes the capacitor to charge to approximately 3.3 volts. The result is a number between 0 and 255, roughly equal to the resistance in kilohms.

This result can be accessed in BASIC using the functions STICK(0), STICK(1), STICK(2), and STICK(3), one for each of the four potentiometers (there are two in each of the two joysticks). When the value of STICK(0) is requested, the PC reads the positions of all four potentiometers; when STICK(1), STICK(2), or STICK(3) is requested, the results of readings that were taken simultaneously with the most recent call to STICK(0) are returned.

The program in listing 1 outputs a continuous display of the value of STICK(0) that can be used while experimenting. Only STICK(0) is used in this article, for the sake of simplicity, but remember that the PC can accommodate *four* copies of each circuit given here, all operating simultaneously.

Naturally, the unknown resistance need not be a joystick potentiometer. It can be a resistor or anything else with a resistance in the appropriate range (see figure 3). To read out the actual resis-

FIGURE 1: Joystick Port Circuit (Simplified)

The joystick position is read by moving the short circuit across the capacitor and measuring the time required for it to charge to about 3.3 volts.

FIGURE 2: Joystick Port Pin Connections

On the PC and PCjr, pins are numbered as seen by looking at the joystick socket from outside the computer. On the PC, pin numbers are usually shown on the connector. On the PCjr (at right), AA01 and BA01 are the missing pins.

tance in ohms, some calibration is required, since the values of the resistors and capacitors inside the joystick port can vary from one PC to another. The program in listing 2 will perform the calibration. At the beginning of each session, readings are taken of two known resistances, one of which is 0 ohms (obtained by shorting across the terminals where the unknown resistor should go); the other should be a resistor with an accurately known value between 100 and 200 kilohms.

The PC can also measure capacitance, but the circuit required is slightly more complicated: it has two components instead of one (figure 4). The idea is to measure the time taken to charge the unknown capacitor in addition to the capacitor inside the PC. The requisite program is shown in listing 3. Again, two calibration values are required; one is 0, obtained by leaving an open circuit in place of the unknown

capacitor, and one should be a capacitor with an accurately known value between about 0.2 and 0.5 microfarads. The program operates over a range of about 0.01 to 0.5 microfarads, with a resolution of about 0.01 microfarads.

To make the PC respond to light level, just substitute a cadmium sulfide photocell for the resistor in the PC ohmmeter circuit. Depending on the characteristics of the photocell, calibration may turn out to be quite complicated. There is probably no one program to suit all cases, but any mathematical formula can be implemented easily on the PC.

The same is true for measuring temperature, which can be done in many different ways. A thermistor—a temperature-sensitive resistor—can be used, but they are often difficult to obtain. An easier alternative is to use a silicon transistor (see figure 5). All transistors are temperature-sensitive to an ex-

Slash Programming Time in Half!

With **FirstTime**TM

- Fast program entry through single keystroke statement generators.
- Fast editing through syntax oriented cursor movements.
- Dramatically reduced debugging time through immediate syntax checking.
- Fast development through unique programmer oriented features.
- Automatic program formatter.

FirstTime is a true syntax directed editor.

FirstTime ensures the integrity of your programs by performing all editing tasks like moves, inserts and deletes along the syntactic elements of a program. For example, when you move an IF statement, FirstTime will move the corresponding THEN and ELSE clauses with it.

Even FirstTime's cursor movements are by syntax elements instead of characters. The cursor automatically skips over blank spaces and required keywords and goes directly to the next editable position.

FirstTime is a Syntax Checker

FirstTime checks the syntax of your program statements, and also:

- Semantics like undefined variables and mismatched statement types.
- The contents of include files and macro expansions.
- Statements for errors as they are entered and warns you immediately.

FirstTime is a Program Formatter

FirstTime automatically indents statements as they are entered, saving you from having to track indentation levels and count spaces.

FirstTime has Unique Features

No other editor offer these features:

The *Zoom command* gives you a top down view of your program logic.

The *View command* displays the contents of include files and macro expansions. This is valuable to sophisticated programmers writing complex code or to those updating unfamiliar programs.

FirstTime's *Transform command* lets you change a statement to another similar one with just two keystrokes. For example, you can instantly transform a FOR statement into a WHILE statement.

The *Move at Same Level command* moves the cursor up or down to the next statement at the same indentation level. This is very useful. For example, you can use it to locate the ELSE clause that corresponds to a given THEN clause or to traverse a program one procedure at a time.

FirstTime is Unparalleled

FirstTime is the most advanced syntax directed editor available. It makes programming faster, easier and more fun.

FIGURE 3: *Measuring Resistance*

The unknown resistance need not be a joystick potentiometer; it can be anything with a resistance in the appropriate range. Because resistor and capacitor values inside the joystick port vary among PCs, some preliminary calibration is required.

FIGURE 4: *Measuring Capacitance*

This circuit is slightly more complicated than that for measuring resistance. Capacitance is measured by assessing the time taken to charge the unknown capacitor in addition to the capacitor inside the PC. Two calibration values are needed.

FIGURE 5: *A Simple Temperature Sensor*

Any transistor can be used in this circuit, as they are all somewhat sensitive to temperature. A resolution of 1°C or better can be obtained, depending on the transistor used. A thermistor can be used, but these are often difficult to obtain.

FIGURE 6: *PC Voltmeter—Economy Model*

This circuit can be used only to measure voltages that are high enough to charge the internal capacitor to the threshold within the allowed time. The useful range is between 5 and 18 volts. It is accurate to within 0.03 volts.

tent and this sensitivity can be exploited to take measurements.

The fixed resistor shown in the diagram should be chosen by trial and error so that the value of STICK(0) comes out near 100 at room temperature. The potentiometer can then be used for fine adjustment. In most control applications, the PC will be used to detect that the temperature has reached a certain level rather than to make quantitative measurements. Note that the value of STICK(0) decreases with increasing temperature. A resolution of 1-degree Centigrade or better can be expected, depending on the type of transistor.

The most important kind of analog-to-digital conversion involves voltage, since other analog quantities can be converted into voltages relatively easily. To make the PC measure voltage, it is

necessary to convert the unknown voltage into a constant or nearly constant current and use this to charge the internal capacitor; the higher the voltage, the shorter the charging time will be. The voltage will then be proportional to the reciprocal of STICK(0), rather than to STICK(0) itself, and resolution will be best at lower voltages—which is as it should be, since small voltage differences matter most when the total voltage is small. Listing 4 is a program that can be used with any of the PC voltmeter circuits given here. It requires calibration from two known voltages, both in the range of the circuit used.

The simplest way to convert a voltage to current is to run it through a resistor; this is the method used in the circuit in figure 6. But this circuit can measure only voltages that are high

enough to charge the capacitor to the threshold within the time allowed, which means that the circuit's useful range is about 5 to 18 volts. Within this range, it is quite accurate. I assembled a test version and calibrated it at 5 and 12 volts using VOLT.BAS; it was accurate to within 0.03 volts for all values between.

Figure 7 is the deluxe model PC voltmeter. Its useful range covers 0 to about 6 volts; more importantly, no adjustments are necessary—the software can do all calibration because there is so little variation among units.

The circuit, a voltage-controlled current source, uses a type 324 quad operational amplifier integrated circuit (op amp IC). The output of the first stage is the same as the input voltage. Resistors R1, R2, and R3 form a summing network. A small, constant bias is

Modula-2 has been hailed as the programming language of the future. Its modular design and built-in error-control features make programming more efficient than ever.

And now there's a system that makes programming more affordable than ever. Interface Technologies' Modula-2 Software Development System (M2SDS).

EASY TO LEARN.

EFFICIENT TO USE.

M2SDS features a "syntax-directed" editor that makes programming easy for beginners to learn. And faster for professionals to use.

With our editor you can enter full statements with a single keystroke. And save up to 90% on typing time. It also gives on-line help in correcting undefined variables and syntax errors—which saves even more time.

Multiple editor windows let you refer to one file while you edit another. That's one more way M2SDS adds hours of more creative, more productive time to your day.

TURN "WAIT TIME" INTO "WORK TIME." When there's no time like real-time, you can count on the M2SDS compiler. Up to 100 lines of Modula-2 text can be turned into native machine code in less than five seconds.

To create programs using your computer's full capacity, there are 18 library modules. And unlike

other low-priced compilers, M2SDS has a linker that assembles the components of your program. Automatically.

BREAKTHROUGH TECHNOLOGY.

BREAKTHROUGH PRICE. M2SDS works with IBM® PC, XT, AT or any other 100% compatible computer. Any programs you develop, you own. And M2SDS is non-copy protected.

For just \$80.88, M2SDS is the complete programming environment. Including editor, compiler, linker, library modules, 8087 support and more.

Or choose the expanded, fully upgradeable SDS-XP for just \$249. Later you can add a debugger, foreign object import module and tool box for even more programming capability. And efficiency.

So whether you're a professional looking for a faster way to program, or a novice looking for an easier way to learn, there's a Modula-2 Software Development System just for you.

Call us today for more information or to order your M2SDS. Find out how our new low in system pricing can put your programming efficiency at an all-time high.

This circuit requires no adjustments and all calibration can be done from software. The useful range of measurement is from 0 to about 6 volts; it is safe to about 30 volts. Note: make certain that input polarity is not reversed.

added to the input voltage so that 0 volts input will not give 0 output current (if it did, the PC's capacitor would not charge and it would be impossible to take a reading). The second and third op amps, the two transistors, and resistors R4, R5, and R6 constitute the current source itself. The voltages across R4, R5, and R6 are held equal; the output current is equal to this voltage divided by the value of R6.

The input and output voltages of the type 324 op amp can swing down all the way to 0 volts, making a negative power supply unnecessary. (For this reason, only the 324 or an exact equivalent can be used in this circuit.) However, a problem is posed by the upper limit of the 324's output voltage, which is 1.5 volts below the positive supply. If the 324 were powered from the 5-volt supply, its output could not go above 3.5 volts, and the capacitor in the PC would not charge within the time allowed. The solution is to power the 324 (and obtain R2's bias voltage) from a higher-voltage power supply. In figure 7, this is shown as a 9-volt battery, but any source of between 7.5 and 30 volts DC will do; the current required is less than 1 mA. If this circuit is built on the prototyping area of the PC Game Control Adapter Card, the PC's positive 12-volt supply can be tapped.

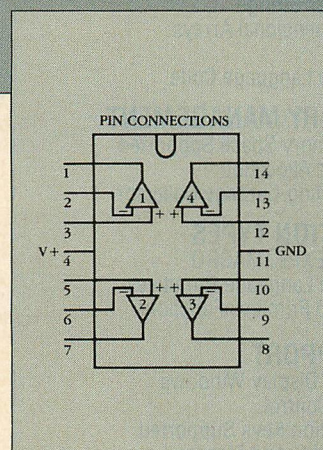

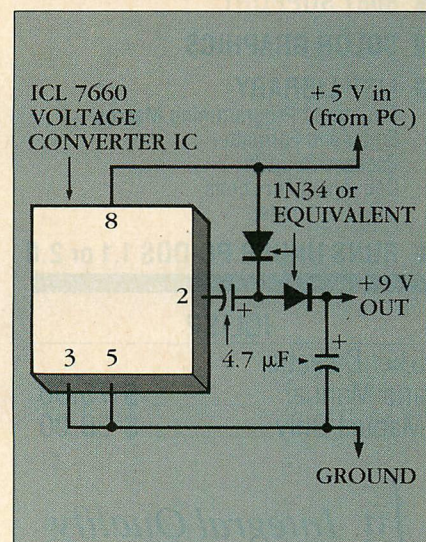

Figure 8 shows a more subtle solution that enables the whole circuit to run off the 5-volt power available at the

joystick port pins. An ICL 7660 voltage converter IC, operating as an oscillator at about 8 kHz, feeds a voltage doubler to give about 9 volts out from 5 volts in. The output voltage is slightly higher if a type 1N34 or equivalent germanium signal diodes are used, although silicon signal diodes (1N914, 1N4148) are suitable.

The component values in the deluxe PC voltmeter are not highly critical, but it is good to use 5-percent resistors of the values specified. R4 and R5 should be well matched. R6 controls the range of readings obtained; adjust it to get STICK(0) to equal about 200 or 220 for 0 volts input, and below 50 for the highest voltage to be measured. The transistors can be any small-signal silicon type (one NPN, one PNP), preferably with gain (beta) above 50. The circuit is designed to virtually cancel out variations in transistor gain.

Used with VOLT.BAS, the deluxe model PC voltmeter performs impressively. Using a breadboarded version of this circuit, I obtained 0.01-volt resolution for readings under 1 volt, 0.03-volt resolution up to 2 volts, and 0.1-volt resolution up to 4 volts. After calibration at 0 and 5.2 volts, the deluxe PC voltmeter agreed with my Micronta digital multimeter to within 0.02 volts, resolution permitting, over the entire 0-to-5-volt range—I am now not certain which of the two is the more accurate!

One precaution: the input of the 324 sources a small current that can be

FIGURE 9: PC Oscilloscope Output

These figures display the output from OSCILL.BAS (listing 5) taken with the deluxe model PC voltmeter circuit, illustrated in figure 7. The top figure shows a 1-Hz square wave; the lower figure shows the charging curve of a capacitor.

as high as 500 nanoamperes, though 20 nanoamperes is more typical. This can distort readings of extremely high impedance voltage sources, such as the charge on a capacitor. A 1-megaohm resistor across the input greatly reduces this effect and makes possible readings through a standard oscilloscope probe in either the 1:1 or 1:10 configuration. Alternatively, the input voltage range can be extended with a voltage divider.

OSCILL.BAS (listing 5) plots a graph of voltage against time, functioning like a chart recorder or slow, single-sweep oscilloscope. The front end is exactly like the PC voltmeter and can be used with any of the same circuits, but the results are displayed as a graph of voltage against time. A sweep takes about nine seconds and could be slowed down by inserting delay loops. (The PC takes the same time to evaluate STICK(0) whether the capacitor charges slowly or quickly; if this were not so, the joystick would be more responsive at one end of its range).

The drawings in figure 9 show the PC oscilloscope's interpretations of, respectively, a 1-Hz square wave and the charging curve of a capacitor, taken with the deluxe model PC voltmeter circuit. The bottom figure shows how the resolution is highest at low voltages.

This PC oscilloscope program is only the beginning. With proper programming, the PC can do far more than any ordinary oscilloscope. It could generate logarithmic scales on one or both axes, mathematically transform the data before displaying it, automatically cut out long, monotonous stretches from the waveform, store the readings, or even plot calculated values against measured ones on the screen. The PC costs little more than a good chart recorder and is a lot more versatile. It can be the most powerful piece of equipment in the laboratory.

High Quality Software Since 1982.

ALL THE TOOLS REQUIRED TO BUILD A PC NETWORK

If you can use a screwdriver and answer some simple, menu-driven prompts, you can build a high performance MS-DOS™ network.

Using an AT or XT as a system file server and PCs or PCjr's™ as intelligent terminals, you can build PC-DOS™ compatible networks that work for as little as \$1300 per user.

HOW? A highly efficient network structure using the best of TurboDOS™ the only true multi-user operating system available for micros today, and ARCnet™, the most popular local area network solution for minis and main frames. Combined with easy to install expansion products designed with speed in mind, Intercontinental's PC networking solution delivers.

PC networking made simple. Not to mention workable and cost-effective.

Call Intercontinental today, and put our years of networking experience to work for you.

When one person has this much influence, he has to know more about state-of-the-art PC technology than anyone else in his company. That's why he reads PC Tech Journal.

Clues that put him on the right path

The articles in PC Tech Journal act as a compass to direct PC experts through the thickening forest of PC products.

This PC expert discovers that Bruce Churchill's article, "Low cost networking for the IBM PC," points to many of the networking products he will need. And William Colsher's tips on sharing files keep him from wandering into the valley of lost data.

Clues that help him perform his best

It's not only the feature articles that give him direction, though.

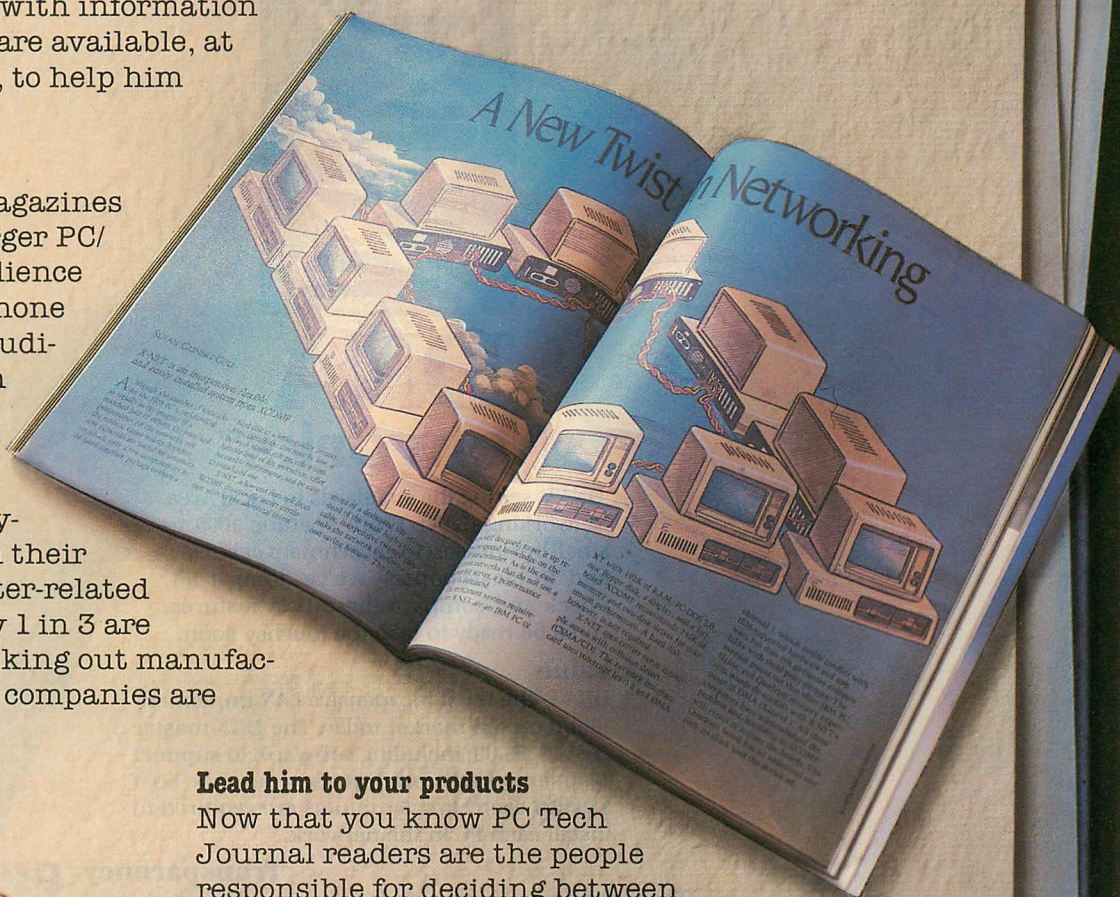

The ads, too, keep him on course. They provide him with information on what products are available, at this very moment, to help him complete his task.

JOURNEY TO THE PROMISED LAN

DNA Networks™ will help get you there.

DNA Networks™

DNA is setting the standards in Local Area Networking (LAN). From Fortune 1000 to small businesses; to government agencies; and to classrooms—we've done it all. Check and compare these DNA features. You'll be ready to take the journey soon.

Value

DNA is the most inexpensive LAN implementation on the market today. The DNA master costs \$695.00, including software, to support 16 users. Additional station boards cost \$395.00 each. Just 5 minutes are required to install each PC in the network.

Transparency

There are no new commands to learn, and no dedicated servers are required. The server PC runs like a normal PC. And the network? You won't even know it's there.

Compatibility

DNA runs on the IBM PC, XT, AT, PCjr, and compatibles running PC-DOS/MS-DOS 2.0/3.0 as well as compatible peripherals.

Enhanced Capabilities

DNA software includes real file and record lock and semaphores; a five printer simultaneous print spooler; file spooling; passwords; message switching, and more.

Performance

DNA outperforms all LAN products that use native operating systems. With faster hardware, DNA will perform faster, too. You'll find that DNA performs even better than networks that require special and expensive hardware and operating systems. DNA requires less than 4K RAM on each user station and only 75K RAM on the master.

State-of-the-Art Solutions

DNA offers a growing list of multi-user software packages, with easy conversions for non-multi-users. Solutions include shared 3270 gateways, electronic mail, second generation educational systems, and floppyless terminal technology for the IBM PC, PCjr and many compatibles.

Service and Support

DNA carries an unconditional 1-year warranty with a \$95.00 replacement fee thereafter; a program called TESTDNA that tests every chip on our boards; and support that our customers call "unparalleled."

Drawing Circuits

*smARTWORK brings computer-aided design
to the artwork used in the production
of printed circuit boards.*

WILLIAM H. MURRAY

Computer-aided design (CAD) tools allow digital circuits to be created and simulated without a human hand ever touching a prototype board, soldering iron, or actual components. Once the design is finished, the bugs worked out of the circuit, and the working model completed, the prototype must be made ready for production. The production process requires a printed circuit board that will hold the actual circuit components.

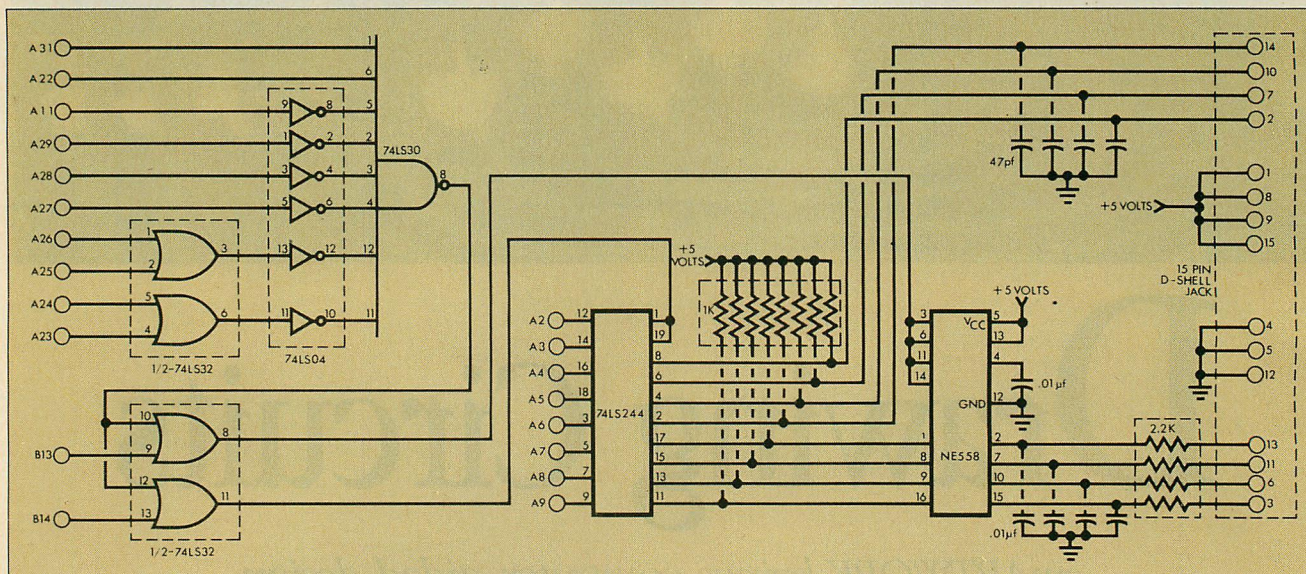

smARTWORK from the Wintek Corporation is software that is designed to aid in the production of the artwork used for printed circuit boards. It is made to work on a PC/XT with 192KB of RAM,

two 360KB disks, a color graphics adapter, and an IBM or Epson printer. A Houston Instruments DMP-41 or DMP-40 pen-and-ink plotter, a Hewlett-Packard 7475A plotter, and a Microsoft Mouse are optional equipment.

Prior to the introduction of computer-aided design techniques, printed circuit board design was a tedious manual task. In his book *Photoresist*, William S. DeForest credits W. H. Talbot, in 1852, with the first patent for a photoetching process that could be used on copper. In 1925 C. Ducas patented a technique that placed a layer of copper on a nonconductive base by stenciling. In 1944 Eisler patent-

ed a printed circuit board technique similar to the techniques used today, but it did not catch on until the transistor age of the early and mid-1960s.

A popular method of circuit board design still used today involves a technique for creating a pattern on a piece of plastic (drafting film) that represents an enlarged circuit board. Copper pathways are laid out with black tape of various widths. Pads where components would pass through a board or connect to other components are shown using another set of sticky black tape patterns. On these one-sided boards, copper pathways can never cross one another, so component placement is very impor-

FIGURE 1: Address Decoder

Assuming the pin assignments shown above, smARTWORK will develop the connection paths on this game adapter

circuit for the XT. The NE555B timer chip and the 74LS244 line driver-receiver chip are used.

tant to minimize wire jumpers on the finished board. Once the printed circuit board design is acceptable, the plastic-tape pattern is photographically reduced and becomes the mask for the photo-etching process.

This method of circuit board design has several disadvantages: once the circuit design is completed, it is difficult to modify (the tape is not reusable, and electrical pathways are more or less set); minor changes often require a completely new circuit board design to be drafted; and the cost of a draftsman for initial layout and future modifications can be high.

GAME BOARD DESIGN

Computer-aided design can overcome these disadvantages. A step-by-step examination of the design process for a game-board adapter for the XT will demonstrate how a printed circuit board can be created on a computer using smARTWORK. The example assumes that the pin connections are already established (see figure 1).

Game-board circuits for the XT, whether offered through IBM, AST, Quadram, or others, are more-or-less standard circuits that consist of an address decoder, a timer, and a line driver/receiver. Although address decoding circuits vary from manufacturer to manufacturer, several companies, including IBM, have settled on the NE555 timer chip and the 74LS244 line driver/receiver chip as standards.

The command structure of smARTWORK is divided into three major categories, as shown in table 1: command line

inputs, display control functions, and single keystroke functions.

The editing environment of smARTWORK is entered by typing EDIT in response to the DOS prompt. smARTWORK should be loaded into drive A: and a formatted storage disk in B:. The product logo will appear on the screen until a key is pressed. Then a blank screen will appear with a small square cursor in the lower left corner. The screen can represent either a 2-inch (vertical) by 4-inch (horizontal) finished board or a portion of a board; the size of the total board can be as large as 10 inches by 16 inches. The user can move into different 2-by-4-inch portions of the larger board by using either the arrow keys or a mouse to move the cursor vertically or horizontally (to the right) of the cursor's starting position.

The game-board adapter being used as an example for this article was designed on an untrimmed 4-by-4-inch board (actual size is 4.2 by 3.9).

If the Return key is pressed once, the command line will request an input. If a mouse is being used, this is the point at which the mouse driver should be installed by typing the word MOUSE, followed by a return.

Printed circuit boards can be designed double-sided with smARTWORK. To view the top of a board, press PgUp, and to view the bottom, press PgDn.

Designs created with smARTWORK will have the following specifications:

- Regular lines will be 12 mils wide (0.012 inches)

- Wide lines will be 50 mils
- Pads will be 62 mils in diameter
- The minimum spacing between conductors will be 19 mils.
- Each movement of the screen cursor represents a finished board distance of 50 mils.

In the game-board adapter example, the edge-strip connectors were placed on the upper and lower surfaces of the board by moving the cursor to the correct positions and placing several fat cells (via the F7 key) in a row. There are 31 edge connectors on each side of the board. The pads for the five ICs and two resistor networks were put on the board with the DIP command. For example, a 140-pin DIP pattern can be placed by typing DIP N 14 3. *N* refers to north of the cursor position, *14* to the total number of pads, and *3* to the number of 0.1-inch intervals between the two rows.

When all the DIP pads are completed, the SIP command is used to place the pads for the joystick jack to the left of the circuit board. For example, SIP N 8 will place eight pads, vertically upward from the current cursor position. Putting an *L* in the lower left-hand corner of the lower board and a *U* in the lower left-hand corner of the upper board will help the user remember which side of the board he is working on after starting to trace the connections from pin to pin.

Figure 2 (lower board) and figure 3 (upper board) show the tracing for the address decoder of the game adapter. Because smARTWORK allows the

C Programmers: Program three times faster with *Instant-C*[™]

Instant-C[™] is an optimizing interpreter for the C language that can make programming in C three or more times faster than using old-fashioned compilers and loaders. The interpreter environment makes C as easy to use as Basic. Yet *Instant-C*[™] is 20 to 50 times faster than interpreted Basic. This new interactive development environment gives you:

Instant Editing. The full-screen editor is built into *Instant-C*[™] for immediate use. You don't wait for a separate editor program to start up.

Instant Error Correction. You can check syntax in the editor. Each error message is displayed on the screen with the cursor set to the trouble spot, ready for your correction. Errors are reported clearly, by the editor, and only one at a time.

Instant Execution. *Instant-C*[™] uses no assembler or loader. You can execute your program as soon as you finish editing.

Instant Testing. You can immediately execute any C statement or function, set variables, or evaluate expressions. Your results are displayed automatically.

Instant Symbolic Debugging. Watch execution by single statement stepping. Debugging features are built-in; you don't need to recompile or reload using special options.

Instant Loading. Directly generates .EXE or .CMD files at your request to create stand-alone versions of your programs.

Instant Floating Point. Uses 8087* co-processor if present.

Instant Compatibility. Follows K & R standards. Comprehensive standard library provided, with source code.

Instant Satisfaction. Guaranteed, or your money back. *Instant-C*[™] is available now, and works under PC-DOS, MS-DOS*, and CP/M-86*.

Find out how *Instant-C*[™] is changing the way that programming is done. *Instant-C*[™] is \$495. Call or write for more information.

user to view both the upper and lower boards at the same time, the upper board in this example is the mirror image of the actual mask. This is not a problem because the film can be reversed photographically. Note that the lower left pin of each chip is pin #1.

Traces are placed on the board by positioning the cursor (with cursor keys or mouse) over a pad and pushing either F1 or the left mouse button. The cursor is then moved to the destination and the appropriate button is pushed again. smARTWORK will search the board for a route between the two specified pads. Depending on the distance between the pads and the complexity of the circuit, this search can take anywhere from a second to a minute.

If no route exists, the appropriate screen message will appear. The only choice then is to flip the board and hope that the route can be completed on the other side of the board. As

shown in figures 2 and 3, for even the simple address decoder, both sides of the board had to be used to avoid shorted conductors. Note especially the traces and the component placement on figures 2 and 3. In later figures, components and traces were moved to permit more efficient use of the board area.

Figure 4 (lower board) and figure 5 (upper board) show the total board design. All ICs, resistor networks, and capacitors have been wired. In addition, all power supply connections have been made. Looking along the edge card connector of the upper board will reveal that several conductors had to be moved in order to place additional traces on the board. This is a fairly easy task. Moving the cursor over a trace and pushing F2—the remove route key—or the right mouse button will cause the trace to be removed.

A new trace can be forced into the desired position with this technique:

TABLE 1: smARTWORK Commands

COMMAND LINE INPUT			
CLEAR	Clears the current screen of all art	Alt-F6	Toggles active layer's color
CLEAVE <direction>	Widens space between traces for additional insertions	Alt-F7	Toggles window size
DIP <direction><pins> <spacing>	Automatically places pads in the correct positions for DIP chips	SINGLE KEYSTROKE FUNCTIONS	
LOAD <file name>	Retrieves previous art	F1 — Mark route	Marks the beginning of a circuit trace or route. It must start at a pad on the board
MOUSE	Loads the mouse driver	F2 — Remove route	Removes a route or trace between pads
QUIT	Returns to DOS	F3 — Place pad	Places a pad on the board. A pad is three-dimensional in that it passes through the board to both sides.
SAVE <filename>	Saves the current art	F4 — Remove a pad	Removes a pad and any traces connected to it
SIP <direction> <pins>	Automatically places in-line pads	F5 — Widen	Increases the width of the trace (conductor) where possible
(Backspace key)	Deletes a character	F6 — Shrink	Reduces the size of a trace that was previously widened
(Esc)	Erases a response	F7 — Place fat cell	Places a square of copper on the board for making connections. Repeated use of fat cells can produce a pattern of almost any desired shape.
(Enter)	Processes a response	F8 — Repeat route	Repeats a routing pattern
DISPLAY CONTROL FUNCTIONS			
Alt-F1	Toggles between color/no color mode		
Alt-F2	Toggles color intensity		
Alt-F3	Toggles color scheme		
Alt-F4	Toggles background color		
Alt-F5	Toggles opaque/transparent mode		

smARTWORK accepts three types of commands: command line input; Alt-function keys; and function keys.

place the cursor on a pad and press F1 (the mark route key); move the cursor a short distance and push F1 again to draw a conductor (trace) from the pad to the current cursor position; move the cursor again (a short distance) and press the key; repeat this procedure until the route is completed as desired. The design process is likely to require quite a bit of trace moving.

smARTWORK offers some useful screen options with an RGB monitor. By pressing Alt-F1, the user is able to switch between viewing a single layer (one-color display) and a dual layer (multicolor display). If a black-and-white monitor is used with the color graphics adapter, the following monitor commands will not provide very good viewing results.

Alt-F2 allows the user to toggle the intensity of the background color. Alt-F3 allows two palettes of colors to appear on the screen: red, green, and yellow; or magenta, cyan, and white. Alt-F4 switches the background from black to blue. Alt-F5 displays two or three colors at one time. If the user is viewing two layers, the active layer (the one being worked on) will appear in one color, and the other layer will be in a different color. Normally, if a trace on the active layer covers a trace on the inactive layer, only the active layer's trace will be visible. With the three-color option, the overlap will be shown in the third color. Alt-F6 swaps the active-layer color

with the inactive layer color, allowing four different color combinations to appear on the screen simultaneously.

Finally, Alt-F7 permits the entire 10-by-16-inch design screen to be viewed at once. Everything on the board appears squashed together on the screen and is difficult to understand. However, this large-view screen may be useful if additional components have to be placed on the board.

Printing circuit board artwork is achieved by first saving the circuit board design and then QUITting the Editor. From the DOS command level, PLOT is used to enter smARTWORK's printing program. Currently, dot-matrix art can be achieved only on IBM and Epson printers (or compatibles). Higher quality plots can be obtained with Houston Instruments DMP-41 or DMP-40 plotters. The latest revision also supports Hewlett-Packard's 7475A plotter.

In figures 2 through 5, the 1X check plot option was used to obtain fast verification of the game-adaptor design. The artwork produced with this option is fast, but not polished. The pads are somewhat square, diagonals have jagged lines, and the fat cells and wide runs have squared edges. All of this was fixed when the final artwork was produced using the 2X mode (figure 6). The 2X plots take 15 to 20 minutes (per side) to complete.

If a plot is made on either an Epson RX-80 or FX-80 printer in the 2X

mode, the largest circuit board that can be printed is approximately 4 inches by 4 inches. The board is printed sideways, with the vertical dimension plotted across the screen, and the horizontal dimension plotted up and down on the sheet. Obviously, for serious production work a plotter must be considered. The border around each board surface can be removed when plotting by typing PLOT -NB after the DOS prompt.

COMPLETE MANUAL

smARTWORK arrives with a single write-protected, copy-protected diskette containing the program, a 128-page manual that completely describes the program operation, and a legal-size license agreement that limits the use of the product to one machine. Wintek will supply one back-up copy of the program if the agreement is returned.

One of smARTWORK's strengths is its manual. It is divided into 19 well-written, easy-to-follow chapters and is extremely detailed (although not wordy) in the operation of the product. Five chapters are devoted to the use of the simple command editor, loading and saving circuit files; use of the display options; control of the screen cursor; placement of circuit pads, traces, and fat cells on the circuit board; and plotting the final design on a printer or plotter.

The remaining chapters simply go into more detail about the commands already presented and explain some ad-

Periscope ... A Direct Hit!

"A great debugger ... If you've been frustrated by programs that don't behave the same for the debugger as when running alone, or that crash altogether, you should check out Periscope ..."

PC REPORT, Boston Computer Society

"It works, and works well!! In the first day of use I finished up two weeks of problems!! Really excellent!!!"

Peter Loats, Periscope User

Periscope's differences hit home! Its breakout switch gives you control, even when interrupts are disabled. Periscope's unique power helps you solve the difficult problems. Debug device-drivers, memory-resident, and non-DOS programs.

Great for straightening out confused C pointers! Using its breakpoint power, you can stop on reads and writes to ranges of memory. Stop on registers, words, and bytes, too.

It's tough. Periscope's 16K RAM board is write-protected. Runaway programs can't touch crucial debugger code! Examine the system, safely, at any time: Periscope saves the interrupt vectors and buffers it uses, then restores them when done. It uses ROM BIOS calls for functions except file access, so DOS can't clobber itself.

It gets you moving. It's commands are similar to Debug's, so you'll master it quickly. On-line help is there when you need it. You can define the windows you want; you can design easy-to-read memory displays. Periscope supports C, Assembler, BASIC, and Pascal. Comprehensive symbol support gives you a roadmap through memory tying back to your source.

It's risk-free. Periscope is backed up by a 30-day, money-back guarantee! The board is warranted for a year. Technical Support? You get the best there is ... direct from Brett Salter, Periscope's author!

It requires. An IBM PC, XT, AT, Compaq, or close compatible; PC-DOS, 64K RAM; a disk drive and an 80-column monitor. With two monitors, Periscope's screen is displayed on the monitor not in use. With one monitor, a keystroke switches screens.

It's power you can afford. At \$295, you can afford Periscope's professional power. The system includes the memory board, breakout switch, debugger software, manual, and quick reference card.

Order now! Call (800) 421-5300, ext. R96, 24 hours a day to order with MasterCard/VISA. Demo disk is \$5. Questions? Please call (404) 256-3860.

vanced techniques and concepts of circuit board design. One chapter describes how to use smARTWORK with the Microsoft Mouse. A mouse will greatly speed up output in extensive circuit board designing. The Mouse Systems Mouse can also be used.

smARTWORK is a very interesting product with which to work. Wintek seems to have paid a lot of attention to detail, because the program works with ease. Commands can be mastered in one or two hours, and circuit board design can begin almost immediately. Four chapters in the manual are tutorial

in nature and will help even the most reluctant user become an eager supporter. For those designers who would like to tie into a small CAD circuit board design system on the XT, smARTWORK is ideal. Applications range from industrial board design to teaching CAD applications on a small system.

Why is
Better
BASICTM

Better than
BASIC?

Here's 6 Reasons Why.

1. 640K. Now you can use the full memory of your PC

2. to develop large programs.

3. **Structured.** Create well organized programs using procedures and functions that are easily identified and understood and completely reusable in future programs.

4. **Modular.** Use procedures and functions grouped together to form "library modules" which are then available to you or anyone else for future use.

5. **Interactive.** BetterBASIC acts like an interpreter because it responds to the users' commands in an immediate mode. However, each statement is actually compiled as it is entered.

6. **Extensible.** Create your own BetterBASIC modules which contain BetterBASIC extensions. This feature, coupled with the easy-to-use Assembly Language support, makes this an ideal OEM language.

7. **Compiled.** Each line of the program is compiled as it is entered into the computer's memory rather than interpreted at runtime. The optional Runtime System generates EXE. files allowing for the distribution of products written in BetterBASIC.

And if That's Not Enough There's More ...

- Speed Sieve of Eratosthenes Benchmark:
 - BetterBASIC: 31.9 seconds.
 - IBM PC BASIC: 191.1 seconds.
- Built-in WINDOWS support!
- Program Block Structures.

- User defined Procedures and Functions.
- Local and Global Variables.
- Shared Variables.
- Recursion.
- Argument type validation.
- and ■ Optional arguments.

BetterBASIC Runs on IBM PC, IBM PC/XT and all other IBM-compatible machines.

Bubble Boards

The need for these expensive (but nonvolatile) bubble memory boards depends on the importance of your data.

Bubble memory technology has been a long time coming for any computer. From its loudly heralded origins in the sixties it has followed a wandering path to the marketplace, bedeviled by industry indifference and costs that failed to fall as quickly as those of RAM and rotating media storage. Several bubble memory products are now available for the IBM

PC product line, and within those market niches in which nothing but bubble memory will do, the outlook for these products is decidedly bright.

The three bubble memory products that will be discussed here are the Helix PC Bubble Disk from Helix Systems and Development Corporation; the PDIB-512 Bubble Memory Board from Pure Data Ltd.; and the MBM-504 Bub-

BUBBLE BOARDS

ble Drive from HICOMP. All three boards have 512KB memory and occupy a single slot in the IBM PC; all use a bubble memory architecture that was developed by Intel Corporation.

Bubble memory is a solid-state device with no mechanical moving parts. Special component packaging makes bubble memory boards impervious to dust, dirty environments, fumes, and vibrations. Bubble memory is well suited for systems that cannot use mechanical storage devices, must exist in a harsh environment, or must have data pre-

served during a power loss. In addition to these general kinds of applications bubble memory can be a useful addition to portable personal computers that may not have the room or the power to support diskette drives.

Bubble memory boards provide enhanced RAM-disk functionality, with the advantage that files are preserved when power is turned off. If desired, a bubble board may become the system boot device. Bubble memory files may be write-protected, preventing unauthorized modifications or deletions.

Storage and retrieval of bubble memory data are faster than diskette but slower than fixed disk and significantly slower than RAM memory.

Bubble technology is an unusual magnetic means of storing data as a function of the presence or absence of moving magnetic domains in a thin magnetic film. The approach was invented by Bell Labs in the late 1960s. The first commercial bubble memory board was introduced by Intel in the mid 1970s. At that time, bubble storage was projected to be faster, cheaper, and denser (permitting more memory in a given printed circuit board space) than disk memory or RAM.

Several semiconductor manufacturers began producing bubble products. Computer and peripheral manufacturers announced products with bubble memory components. Prices failed to come down as rapidly as they did for disk memory and RAM. The perception that bubble technology offered few performance advantages at a higher price brought the growth of the bubble memory industry nearly to a halt. Products with bubble components were discontinued or upgraded to include more conventional components that offered a better price/performance ratio. Soon Intel alone continued development and production of bubble components.

Steady evolutionary (not revolutionary) improvements in density and considerable cost reductions in the last eight years have made bubble technology viable and marketable. Although the window for major market penetration in the mainstream of personal computing has been lost, a more specialized market may be emerging.

CHIP-LEVEL TECHNOLOGY

All three bubble boards tested use the same Intel chip design. Photo 1 (Pure Data's 512KB bubble board) shows four large square blocks on the board; these squares are Intel 7110 bubble memory units. Below each 7110 unit is a set of support chips that provides the computer interface to bubble memory itself.

Data are stored by the presence (representing a 1 bit) or absence (a 0 bit) of a magnetic domain (bubble) within a very thin, rare earth/iron oxide garnet film. The film has magnetic properties that determine the shape and movement characteristics of bubbles induced within it.

Bubbles are so named because in photomicrographs they look like spheres; actually they are cylindrical, equally wide and tall. Magnetic domains are regions of similar magnetic polarity

LATTICE® WORKS

LATTICE, INC. OFFERS C COMPILERS

The industry's standard C compiler, Lattice C, is now published directly by Lattice. You can obtain editions of Lattice C from other publishers, but when you purchase our edition, you get support directly from the people who wrote the C compiler. And when you register your purchase with Lattice, you are notified of all updates and enhancements. You will also be notified of the new C programming tools as they become available from Lattice.

When you are ready to purchase a C compiler, consider the source. Then call Lattice, Inc.

LATTICE OFFERS C COMPILER UPGRADES TO MICROSOFT USERS

Lattice announces the opportunity for users of the Microsoft MS-DOS C compiler to upgrade to the standard Lattice C and obtain a free copy of Lattice's new C-SPRITE symbolic program debugger.

According to Dave Schmitt, Lattice, Inc. President, "Until recently, the Microsoft C compiler was an early version of our compiler. Now that Microsoft has switched to their own compiler, we feel that purchasers of the earlier product deserve a low-cost way to remain compatible with the latest Lattice technology and the extensive third-party support for the Lattice product."

The upgrade kit costs \$150 and includes Version 2.20 of the Lattice C compiler with its new two-color, typeset manual and the C-SPRITE program debugger. (The regular retail prices are \$500 for the compiler and \$175 for C-SPRITE.)

This offer to Microsoft C users expires July 31. Upgrade orders must be accompanied by the original Microsoft diskettes.

LATTICE C USERS' GROUP FORMED

An independent Lattice C Users' Group has recently been formed, and is headed by Bill Hunt, author of the book, *The C Toolbox*. The group will serve users of Lattice C, but membership is open to any C compiler users.

Members will receive a bi-monthly newsletter explaining C features and providing examples of their use, exploring new ways to use Lattice C, and will include a question and answer column. The newsletter will be supplemented by a disk containing source files, demo programs and library functions, and the best of the public domain C programs.

Lattice, Inc. will provide complete support for the new users' group by sharing new plans, discovered bugs, and "tech" tips.

Register your C compiler now to receive complete information on joining the Lattice C Users' Group.

ASK ABOUT OUR "TRADE UP TO LATTICE C POLICY"

After purchase, return registration cards for free subscription to the "Lattice Works" newsletter and important information about the Lattice Users Group.

TAPE IT EASY.

Boy, are you in for a surprise. You know you need mass storage. And you know you need some kind of backup.

But what you don't know is that making a backup from your hard disk can take the patience of a saint. And tax the memory of an elephant.

Unless, of course, you have a little TLC. The new TrimLine Combo from Corvus. You get mass storage (20 Mbytes). The incredible speed and efficiency of a hard disk. And an integral tape backup.

But there the similarity between a Corvus and anything else ends.

First of all, your TLC fits in beautifully. Between your IBM PC's monitor and base. No bulky boxes. And no clumsy cables and wires to trip over.

Next, you get the world's easiest tape

backup system. If you like using command lines, fine. The TLC will accommodate you. But if you're more interested in simplicity, just use one of the TLC's menus. And one of your fingers.

You can back up the entire disk. All your data for the day. A group of selected files. Or just one single file. As a matter of fact, you can back up whatever you want. Which will save you quite a bit of time and aggravation.

You'll also find backed up files in seconds with the TLC's Directory. No more searching an entire tape just to find one file.

Finally, you'll enjoy the backup speed of the TLC. There's no formatting of blank tapes (which can save you about two hours). And no worry about losing data to bad sectors the format has called good.

Scared? Don't be. Just tape it easy. Check out the TrimLine Combo from Corvus.

In addition to all the features, it's one of the lowest-priced tape backup systems you can find.

F77L LCS-FORTRAN FOR IBM/PC CHALLENGES SOFTWARE GOLIATHS

When you have the superior product you can take on (and beat!) the big guys.

Up until now FORTRAN programmers have had to get by with ponderous and incomplete Language Systems that never fully meet their needs or expectations. With F77L Lahey Computer Systems resolves this situation. F77L is a complete ANSI 77 Standard FORTRAN Language System with fast compile speed and productivity-enhancing diagnostics.

If you need a FORTRAN Language System, don't go to a Goliath who just happens to carry a FORTRAN product: call LCS, the company with the superior product.

Here are a few of the many reasons to buy F77L:

- Full FORTRAN 77 Language with popular extensions.
- Fast, compiles 100s of statements/minute (PC/XT).
- Numerous, specific English language diagnostics displayed during compilation.
- Command Line compiler options.
- Execution error traceback: program unit & line number.
- Optional protection for constants, bonds, interfaces.
- Standard or Free Format source files.
- Lattice C compatibility.
- Optimized code or high-speed execution.
- Easy to use manual includes appendices on interfaces to Lattice C and Assembly language.

If you are tired of betting on the software Goliaths, and losing, call LCS the FORTRAN SPECIALIST—ask for David.

BUBBLE BOARDS

within a partially-magnetized region. A magnetically saturated film has one predominant magnetic domain. Nonmagnetized film contains domains existing at random three-dimensional positions. A thin film magnetized to a level less than complete saturation has a majority of domains oriented in a common direction; when the film is very thin (less than .001 inch thick), the possible orientations of the domains are reduced from three dimensions to a two-dimensional plane.

Magnetization of such a thin film with the proper crystallographic properties (for example, silicates such as garnet) at a level less than complete saturation creates isolated domains with one magnetic polarity within a larger domain with uniform and opposite orientation. The isolated domains that are created are magnetic bubbles.

Bubbles are nonvolatile because they are created by magnetization; electricity is not needed to preserve their existence. As a protective measure, bubble memory is packaged within a magnetic shield to filter any potentially disruptive external magnetic interference.

Bubbles must be moved to create and modify data patterns. Electric currents create magnetic fields that cause bubbles to move toward an opposite magnetic polarity, much as a magnet pulls an iron nail. Different magnetic fields are created using two electric coils that completely surround the garnet film, causing the bubbles to move through a modified region of the film that is shaped like a closed loop. Bubble and disk data both appear to move, but bubble data rotates on a stationary media, while disk media rotate carrying stationary data. The loss of electricity

stops bubble movement and prevents further modification of bubble patterns.

Bubble memory shares some I/O characteristics with disk drives. Both must deal with latency: bubble memory latency time is the time spent waiting for data to move into the proper loop position for replication to the input track (see below); disk latency is the time spent waiting for a disk platter to rotate desired data into position under the read/write heads before I/O transfer begins. Bubble I/O is done in blocks, as is disk I/O. Neither bubble nor disk data can be addressed on a byte basis.

Figures 1 and 2 shows the architecture of a bubble memory unit. Data move around the circular loops continuously, while the input and output tracks provide an access point and data channel to each loop for the reading and writing of data. The bubble detector senses the presence of bubbles during read operations and converts this information to an outgoing digital bit stream. The bubble generator converts incoming digital data patterns to patterns of bubbles during memory writes.

The bubble generator creates bubbles using a seed bubble, an oversized kidney-shaped magnetic domain. Through electrical excitation the seed splits into two parts. One part remains as the seed and quickly regains its former size and shape; the second part transfers to the input track as a bubble.

The seed resides on an easily magnetized alloy of nickel and iron. The magnetic field that is created by a local electric current, the currents rotating the nearby bubble data, and the shape of the electric conductor used to create the seed combine to maintain the seed's kidney shape.

FIGURE 1: Bubble Memory Chip

This representation of a bubble memory chip shows the relationship of the input track, output track, and several storage loops with bubble moving through them.

Artificial
Intelligence
language for
your IBM®
compatible
personal
computer

Through a major breakthrough in the development of Artificial Intelligence applications, a unique version of Prolog is now available for your personal computer. It is called **MPROLOG P-500**. MPROLOG P-500 is an extended, programmer-friendly edition of Prolog — the computer language selected as the basis for the Japanese Fifth Generation Computer Systems Project.

MPROLOG has been specially designed for:

- Software developers
- AI innovators
- Expert systems researchers and developers
- Corporations seeking a competitive edge

How MPROLOG Programming Works

An MPROLOG program consists of **FACTS** and **RULES** expressed in a natural way. The inference mechanism for answering questions or arriving at conclusions based on **FACTS** and **RULES** is built into the language. This language allows you to write powerful software faster and easier than with traditional algorithmic languages. MPROLOG extends your computer's ability from its current tasks of processing and manipulating data to reasoning tasks that are based on the knowledge you provide it.

"...if programmed with the statements 'Boston is the capital of Massachusetts' and 'All capitals are cities', the system could deduce that 'Boston is a city'. As witnessed by the actual notation for the first statement — (capital of/Boston Massachusetts) — the language is declarative and easy to learn."
— High Technology,
December 1984

MPROLOG P-500 Offers Seven Key Features

- Easy to learn.
- Flexible enough to let you tailor your expert systems.
- Supported by Logic Lab, a powerful, interactive programming development environment to maximize convenience and productivity.
- Designed for the **modular** development of AI applications to reduce their complexity and to enable a programming team to concurrently develop applications.
- Machine independent. Any application written in MPROLOG on one machine can be transferred to or run on any other machine with a run-time implementation of MPROLOG.
- A full-featured implementation of PROLOG. It contains **over 200 built-in predicates** including DEC-10 compatibilities

- Built to offer performance, productivity and portability
- MPROLOG P-500 on your IBM® PC or compatible system lets you take the identical, unaltered MPROLOG application code running under PC DOS and run it under: IBM® VM/CMS; IBM® MVS/TSO; DEC VAX/VMS™; DEC VAX™/UNIX™; M68000 UNIX; and TEKTRONIX 4404 UNIFLEX and other AI work stations.

BUBBLE BOARDS

Data are written to bubble memory by timed, synchronous transfers of bubble patterns to the input track. A bubble generated onto the track represents a binary 1; to represent a binary 0, no bubble is generated for that time interval.

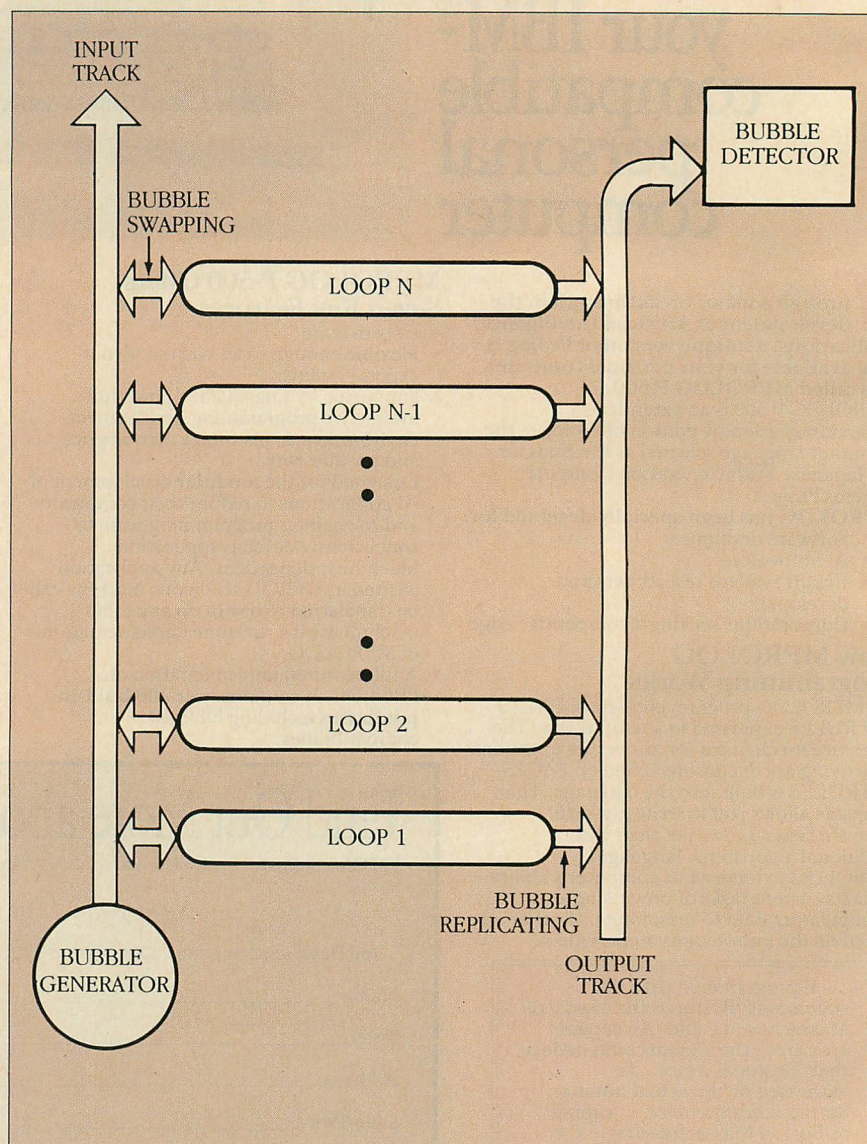

Writing a block of data to bubble memory takes several steps. Assume for the sake of explanation that the simple bubble memory system shown in figure 1 has 320 loops. (Actually, the Intel 7110 chip has its 320 loops distributed among four smaller sections to improve performance; see below.) Of the 320 loops, 256 are used for data transfer. One bit is transferred to or from each loop in one simultaneous transfer, for a total of 256 bits or 32 bytes.

First, 32 bytes of digital data are converted to a bubble pattern and writ-

ten to the input track. The bubble pattern travels down the input track until each of the 256 bits is adjacent to one of the destination loops. The bubbles in the loops are moving continuously around the loops, so there may be a waiting period (latency) while the desired bubble position in each loop moves around to a position adjacent to the input track. When the proper position in each loop has rotated to the correct point, 256 bits (32 bytes) of data on the input track are swapped to bubble memory. Adjacent bubbles on the input track and the loops physically change places; it is not a copy-type operation.

The input track now contains 32 bytes of data that were swapped out of the loops. These bubbles continue to the physical end of the input track (the

FIGURE 2: *Bubble Memory System*

Data stored as bubble patterns move around the circular loops; the input and output tracks provide an access point and data channel for reading and writing data.

track is a unidirectional, noncircular, conductive medium), where they are magnetically destroyed.

This explanation of a bubble memory write assumes no spare loop tracking and 256 contiguous active loops. Spare loops are used when excessive loop errors are detected by the controller (a function identical to disk spare tracking); when the spare loops are present, the 256 active loops are no longer contiguous. Therefore, a pattern with more than 256 bits is generated with filler space appearing adjacent to inactive loops.

The read operation is similar, except that data are replicated (not swapped) from the bubble loops to the output track. The bubble detector converts the pattern to a digital signal.

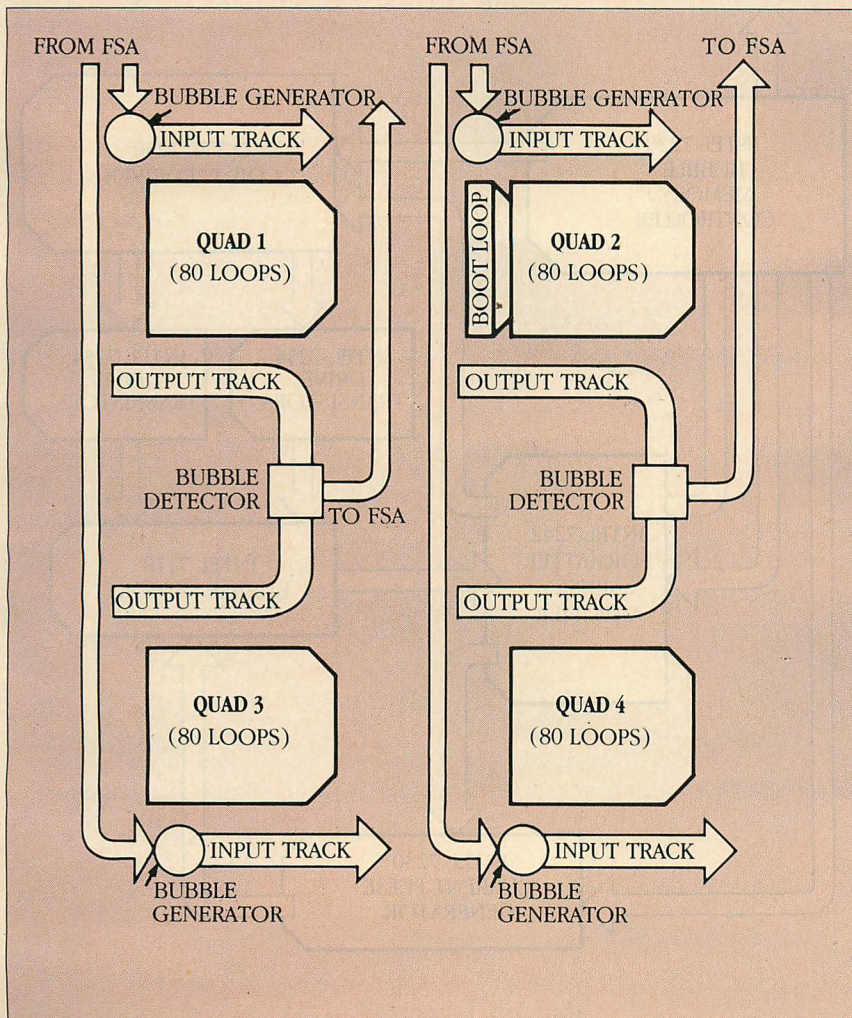

The Intel 7110 bubble unit is a one-megabit storage device. Four of these units store four megabits of information organized as 512KB (see photo

1). Each of the 7110 units has 320 loops, with each loop holding 4,096 bits in a continually rotating bubble pattern. Of the 320 loops, 256 are used for data, 16 are used for error correction, and 48 are spares. A special "boot" loop records the active data loop locations, so that bad loops may be avoided.

To improve performance, the Intel 7110 is organized into four quads of 80 loops each. This arrangement shortens the length of the input/output tracks, reducing the amount of latency time during I/O. Figure 3 shows a diagram of the Intel 7110, with four quads, four sets of I/O tracks, two bubble detector units (that are shared by pairs of the quads), and the boot loop.

Bubbles move through their loops at the rate of 50 KHz, or 50,000 revolutions per second. The time required for a bubble to move from the bubble generator along the input track to a position adjacent to the proper loop, plus

BUBBLE BOARDS

the average rotational latency of bubbles on the loop, is 41 milliseconds.

Figure 4 shows a block diagram of the Intel bubble memory system used on each bubble board. The system consists of a 7220 controller, 7110 bubble unit, 7242 formatter/sense amplifier, 7230 current pulse generator, 7250 coil predriver, and two 7254 driver transistor assembly chips. Each 512KB board has four sets of chips.

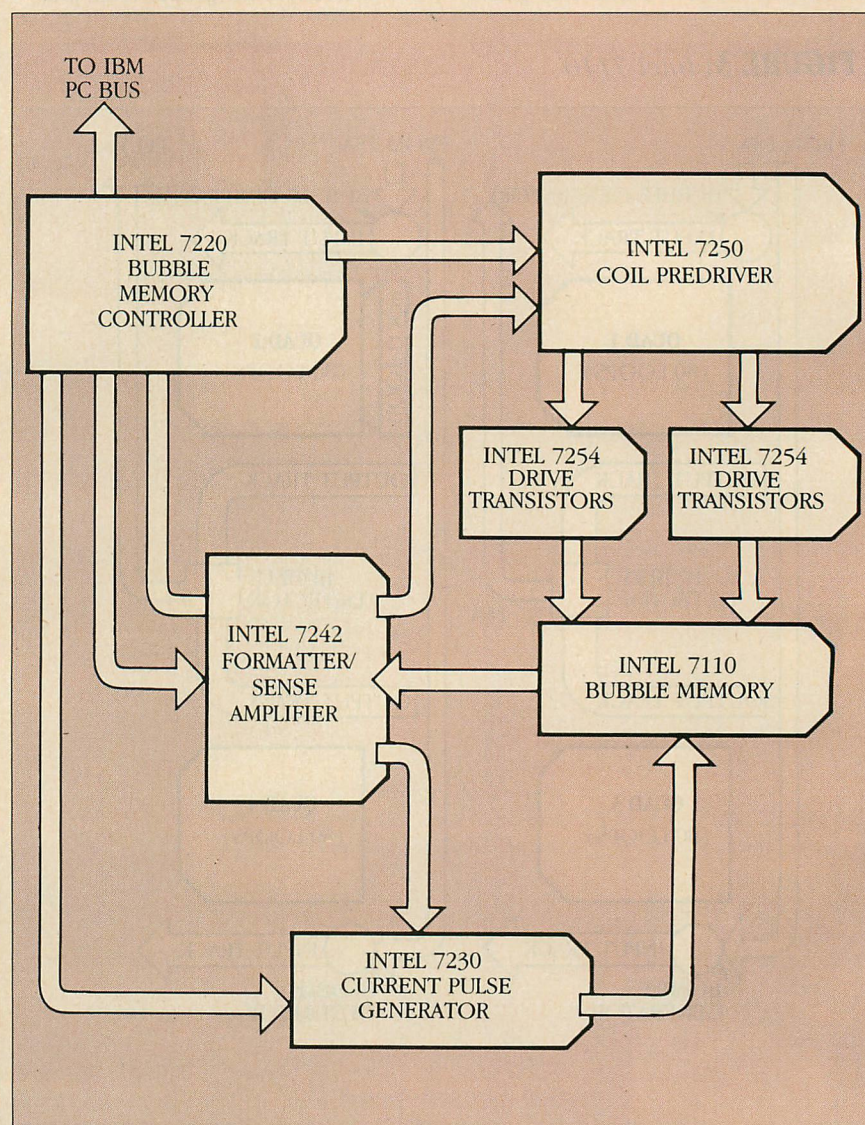

The Intel 7110 is a one-megabit bubble unit that contains bubble loops, I/O tracks, bubble detectors, and bubble generators. Also present is a magnetized field that is responsible for the shape and existence of bubbles on the film. In addition, the 7110 is enclosed in an integral shield that prevents external magnetic fields from corrupting its bubble-memory data.

The Intel 7220 bubble memory controller is the interface between the PC and the bubble subsystem. Sixteen controller commands (see table 1) provide I/O capability using direct memory access (DMA) for faster data transfer; many of the commands utilize a 40-byte FIFO buffer to send information to other chips in the bubble subsystem.

The third chip in the bubble memory unit is the Intel 7242 formatter/sense amplifier (FSA). The 7242 performs error-correction encoding and decoding, maintains spare loop information, and transfers data between the loops and the input/output tracks. The controller communicates with the FSA through the FIFO buffer.

The Intel 7230 chip is the current/pulse generator (CPG), which supplies current to split the seed bubble. The

FIGURE 4: Intel Bubble Memory System

The Intel memory system shown in this block diagram is used on each of the boards. A 512KB bubble board has four sets of chips, each storing 128 KB.

TABLE 1: Controller Commands

COMMAND	FUNCTION
Abort	Terminates the command currently being executed by the 7220. Command is accepted only when the controller is in status <i>busy</i> .
MBM Purge	Clears 7220 internal registers, counters, and the magnetic bubble memory address RAM. Also determines how many 7242 channels are present.
Software Reset	Clears controller FIFO and registers except those containing initial values. Any 7242s present are reset.
Write Seek	Rotates the bubble memories to a designated page address location. No data transfer occurs. The command selects the page immediately prior to a page.
Read Seek	Rotates the bubble memories to a designated page address location. No data transfer occurs. The command selects the page immediately prior to a page.
Read FSA Status	8-bit status of 7242 (formatter/sense amplifier) chips is read and stored in the controller FIFO.
Read Bootloop Register	Bootloop Register of the selected 7242 channels is read and stored in the controller FIFO.
Write Bootloop Register	Causes the data pattern in the 7220 FIFO to be written to the designated 7242 bootloop register.
Write Bootloop Register	Same as Write Bootloop Register command, but Masked excess valid loops beyond 272 are not written.
Read Bootloop	Controller reads the bootloop from the selected bubble memory and stores it on the FIFO.
Write Bootloop	Existing contents of the selected bubble memory's bootloop are replaced by the new bootloop data contained in the 7220 FIFO. Encoding of the bootloop data is done by the controller.
Read Corrected Data	Controller reads into the FIFO a 256-bit block of data from the FIFO of each 7242 channel after an error has been detected. Data are cycled through the error-correction network and transferred to the controller. The 7242 then reports to the controller if the error was recoverable.
Read Bubble Data	Data are read from bubble memory into controller FIFO. Starting location and transfer length are defined in parametric registers of the controller.
Write Bubble Data	Data are read from controller FIFO and written to bubble memories. Starting location and transfer length are parametric registers.
Initialize	Controller determines number of 7242 channels present, reads and decodes the bootloop from each bubble memory, and stores the data in the corresponding 7242 bootloop register.
Reset FIFO	Controller's FIFO area is cleared.

Many of the Intel 7220 controller commands shown here utilize a 40-byte FIFO buffer to send information to other chips in the bubble subsystem.

CPG also initiates the swap and replicate functions that take place between the input/output tracks and loops.

Two other types of chips complete the Intel bubble memory subsystem. The 7250 coil predriver and 7254 quad drive transistors drive two coils positioned at right angles to create an electromagnetic field that causes the bubbles to travel through the loops. One 7254 is required for each of the coils.

The ruggedness of bubble boards surpasses that of most other boards. Based on Intel specifications, the bubble

chip operates at a temperature of 150 degrees Celsius for 168 hours with no failures, endures 100 temperature cycles of -65 degrees Celsius to 150 degrees Celsius with a failure rate of 1.5 percent, and withstands shocks of 200 Gs and severe vibrations of 2 Hz to 2 kHz at 20 Gs, with no failures.

BUBBLE BOARDS

uration switches and/or jumpers, and an EPROM (Electrically Programmable Read-only Memory) chip with software to interface the bubble device with DOS and service system interrupts directed to the bubble board.

Many PC boards require EPROM code for proper operation; in addition to bubble boards, the new IBM Enhanced Graphics Adapter, Fixed Disk controller, SNA, and other communications boards need EPROM code. The software contained in EPROM is similar to software contained in the IBM BIOS, and in some cases, on-board EPROMs replace BIOS routines (the Enhanced Graphics Adapter EPROM replaces several BIOS routines). In other cases, EPROMs create interrupts or other links to the IBM PC system.

A feature called *ROM scan*, which is integrated into IBM BIOS chips manufactured after 10/27/82, enables EPROM programs and the hardware they service to be used by applications programs without requiring that driver programs be run when the PC is re-

started. ROM scan examines addresses in the range C8000 to F4000 in search of EPROM software. The scan routine recognizes EPROM software when it finds a word of 55AAH on a 2KB boundary, and the EPROM program passes checksum verification, using the third byte of the program as a length indicator. The system uses the fourth byte as the address of a subroutine to be executed on system power-up.

The bubble boards provide configuration switches for determining the EPROM address; the documentation also describes how to use the DOS DEBUG program to select an address space not being used by another board.

The manuals for Helix's and HICOMP's bubble boards describe how to determine whether ROM scan is available in the PC's BIOS (Pure Data's manual did not). If an old version of the IBM BIOS chip is present, Helix and HICOMP boards require that a supplied software program be used after every system restart for the bubble drive to be recognized. Pure Data's board does

PHOTOGRAPH • STEVE BORNS

not provide software to emulate ROM scan and recognize the bubble board, so the new BIOS chip must be installed.

All PC/XTs and PCs with 256KB motherboards should have the correct ROM BIOS, so users with these machines may be able to assume their BIOS has the ROM scan provision. (However, ROM chips may be plugged into a motherboard of any configuration, so users would be wise to check.) DEBUG can be used to look at location \$FFFF : 5; the BIOS version date stored there should be 10/27/82 or later.

Each of the three boards requires that configuration information be set through switches on the board. Documentation describing switch-setting for each is straightforward and each board functioned correctly when properly installed.

Ease of installation notwithstanding, the boards have too many switches. The Pure Data and HICOMP boards have 18 switches and the Helix has eight jumpers and one switch. The configuration process needs simplification; an easier approach would be to remove the switches and prompt the user for configuration information that is saved in bubble memory. Many users will have trouble making a large number of configuration decisions through board-level switches; if the user makes a mistake or wants to change the way he operates a board, he must open the PC's chassis.

Generally, the documentation that is included with the boards is poor. HICOMP's manual consists of stapled sheets in letter-quality print format. The Pure Data product summary sheet describes documentation as being in "IBM 3-hole binder format," although the package contains a photocopied, reduced-size spiral-bound manual. The Helix manual is professionally bound, but the type quality is mediocre.

Only one problem arose during installation of the bubble boards. The Pure Data board initially did not operate as a diskette drive, and the system did not acknowledge the presence of two diskette drives on the PC/XT. This problem was the result of an error in documentation: the manual did not cite the need to update the switch on the IBM System board that specifies the number of diskette drives on-line.

The only clue to this problem is buried in an appendix of the Pure Data manual that describes error messages and their causes. This lack of information is a serious omission, because users may not remember that the IBM PC has a switch for the number of diskette drives and they probably will not auto-

matically read an appendix chapter of error conditions.

Each board emulates a diskette drive; the Helix board also emulates a fixed drive. Pure Data has announced that a future release of its board will add fixed-disk emulation. Up to four Helix boards can be installed per IBM system, as long as ample power and expansion slots are available, but the PC can support only one of the HICOMP and Pure Data boards.

The Pure Data board offers fast-speed mode to optimize performance

and slow speed (at one-half the speed of fast mode) to minimize power consumption. The documentation recommends slow speed for "heavily loaded expansion slots in portable PCs." Slow-speed mode performs two serial transfers of data from the four 7110 units, whereas fast-speed mode transfers in parallel from all four units.

The operational speed of the three boards is different. William Hunt's benchmarks (see "Fixed-disk Benchmarks," *PC Tech Journal*, November 1984, p. 64), summarized in table 2,

Alpha Delta MACCs — very low cost insurance on your total equipment investment

Modern solid-state circuitry is even more vulnerable to that old bugaboo, lightning. Strikes miles away can cause damage. So can transient currents from such common things as electric motors and fluorescent lights.

But Alpha Delta Master AC Control Console's **3-stage 2000 amp surge discharge, automatic restorable circuitry** clips off the power surges and spikes to provide clean AC power. (Several typical competitive devices use only a single stage 100 amp protector.) Its resettable circuit breaker adds further protection.

Both MACCs give you control convenience, too. Your components plug into "U" ground outlets and

lighted rocker switches turn them on or off. One outlet is always "hot" for continuous power. **And a master switch turns your entire system on or off.**

MACC and MACC-4 models are identical except for number of outlets. The MACC has 8 clean AC outlets; the MACC-4 has 4.

Units are tested to IEEE pulse standards and rated at 15A, 125VAC, 60 Hz, 1875 watts continuous-duty total. See label for surge protection limitations.

An expansion chassis is a must for anyone who needs to go behind the PC's minimum configuration. Simply plug the I-Bus Six-Pac Expansion Chassis into one slot of your PC—and you've doubled your expansion slots from five to a total of ten. There's no special addressing or software required. Cards plugged into the Six-Pac perform exactly as if they were in the main system unit.

And there's plenty of power, too, because chances are your PC will run out of power before it runs out of slots. The Six-Pac's 40W supply quietly powers its own slots, with negligible power drawn from the PC.

measure the relative performance of the bubble boards. The Helix board is marginally faster than the Pure Data board in fast mode, with the HICOMP board coming in third. The Pure Data board in slow mode is the slowest performer.

Other features are unique to individual boards. The Helix board has an on-line/off-line switch located on the back of the board that is accessible when the PC is operational. Helix offers board compatibility with Softech Pascal IV.13 and CPM-86, in addition to MS-DOS support. All three boards are compatible with MS-DOS 2.0. HICOMP is the only board that does not work with MS-DOS 3.0; under 3.0, the HICOMP board causes the PC to hang indefinitely when bubble memory is read, thereby requiring a reboot.

A unique feature of the Pure Data bubble board is password protection, which prevents unauthorized access to the bubble drive or the entire PC system, based on the user's choice. Password capabilities are enabled through the setting of a board-level switch. Two passwords are available: the master password authorizes system access and the changing of master and user passwords, and the user password merely grants access to the system. Another board-level switch is set to force access to the master menu, to change passwords, and to perform other master access functions. Proper password entry also requires that the user type each letter in the password correctly; he has five attempts to get it right.

The password feature offers five modes of password protection: password protection is disabled; password entry is required on power-up and system reset—otherwise, system access will be denied; password entry is required on power-up—otherwise, system access will be denied; password entry is required on power-up and system reset—otherwise, access to the bubble drive is denied; and password entry is required on power-up—otherwise, access to the bubble drive is denied.

The Pure Data board formats its diskette drive emulator with 360KB, an exact emulation of an MS-DOS floppy diskette, but one that also entails a waste of approximately 152KB of bubble memory. The Helix and HICOMP boards emulate diskette drives of 512KB and waste nothing in the process.

DISKCOPY and DISKCOMP are the only MS-DOS disk-related commands not supported with the Helix and HICOMP electronic disk emulations; Pure Data supports all commands. (Note that the Helix board is a fixed-disk emulation, which should not support these commands; the HICOMP diskette-drive emulation should.)

The three boards reviewed here are very similar. Future market differentiation in bubble memory boards will involve added software, add-on functions, price, or higher performance bubble units (which already exist). The Pure Data board offers poor documentation and a 360KB format that wastes about 152KB of memory. It did, how-

Direct PC to System 34/36/38 Connections Using Standard Twinax Cable

It's Easy With AST-5251/11:™ Fast Hookup, File Transfer And Extra Capabilities

Standard Twinax Cable Support Makes Installation A Snap.

AST-5251/11 and twinax connection means easy, cost effective direct cable attachment of your PC to your IBM® System 34/36/38—no expensive communications adapter necessary. Just plug our AST-5251/11 emulation board into your PC/AT/XT, portable or compatible and connect the twinax cable. With this complete hardware/software solution that's all it takes to use your PC just like a standard IBM 5251/11 terminal.

File Transfer Is Only The Beginning. Use your PC as always, and emulate a Model 11 terminal—with powerful extra capabilities—to access your host minicomputer. Then transfer files bi-directionally between your host and PC, in a ready-to-use format.

Use Your Favorite PC Software.

AST's file transfer support not only eliminates the burden and the errors of re-keying, it adds the ability to manipulate transferred data using your favorite PC software packages, like Lotus 1-2-3™ and WordStar.® And our Hot-Key support lets you conduct concurrent DOS and host sessions, while our applications program interface (API) makes integrating PC and host applications simple.

Even Greater Efficiency.

AST-5251/11 also provides host-addressable 5256 printer emulation for your PC printer in a background mode.

ever, run a close second in the test for speed and it costs \$500 less than its competitors. The HICOMP board is the slowest performer and is not compatible with DOS 3.0. (A revision should solve this problem, but HICOMP has not announced any revisions.) Testing of the Helix board revealed no major problems. Its documentation and performance are the best currently available—although the documentation could be improved—and it has the advantage of allowing four boards to be installed in a single PC.

At one time, bubble memory subsystems were prohibitively expensive. It would have been difficult to justify the cost of a bubble unit even two years ago. Now, although bubble boards are still expensive—especially compared to the 20MB fixed disks that are available for less than \$1,200—a case can be made for their inclusion in systems that must endure environmental conditions that might destroy moving media.

The case for using bubble memory in portable computers is less clear, especially with the cost of CMOS RAM go-

ing down every month. It is important to remember, however, that loss of the lithium battery that keeps CMOS RAM alive translates into loss of data; on the other hand, no matter what the state of the power system is, bubble memory always keeps data alive. If the data are sufficiently important, that may be justification enough for investing in bubble memory.

Programmers' Pfantas

Phoenix makes programmers' dreams come true. With the best-engineered, highest performance programming tools you can find. A full line of MS-DOS[®]/PC DOS programs and utilities no other company offers. All designed to help you write, test and deliver the best programs possible. Top-of-the-line quality at a price you can afford. And all these products are available for the IBM[®] PC, XT,[™] AT[™] and compatibles.

Finally, A Lint For MS-DOS.

Now you can get the full range of features C programmers working in UNIX[™] have come to expect from their Lint program analyzer.

With Pre-C[™] you can detect structural errors in C programs five times faster than you can with a debugger. Find usage errors almost impossible to detect with a compiler. Cross-check multiple source files and parameters passed to functions. Uncover interface bugs that are difficult to isolate. All in a single pass. Capabilities no C compiler, with or without program analyzing utilities, can offer. In fact, Pre-C outlits Lint, since you can handle analyses incrementally.

Pre-C's flexible library approach lets you maintain continuity across all the programs in your shop, whether you use Pre-C's pre-built libraries, pre-existing functions you already have, or some you might want to buy yourself.

Plus, you're not limited to one particular library, and Pre-C keeps track of all the libraries you're using to make sure that code calls them correctly. **\$395.**

Assemble Programs Twice As Fast.

Pasm[™]86 will assemble MASM files two to three times faster than MASM 3.0. Pasm86 supports 8086/88, 8087, 80186 and 80286 processors.

With Pasm86's built-in defaults, you can write code quickly since you won't spend hours learning all the control statements needed at the beginning of your program. You can define symbols on the command line. Decide whether you want error messages or not. And, put local symbols within procedures. **\$295.**

Still Fixing Bugs The Hard Way?

Pfix[™]86 Plus, the most advanced symbolic debugger on the market, eliminates the endless error searches through piles of listings. Locate instructions and data by symbolic name, using symbolic addresses. Handle larger, overlaid programs with ease.

An adjustable multiple-window display shows source, object code and data, breakpoint settings, current machine register and stack contents simultaneously. An in-line assembler allows program corrections directly in Assembly language. Powerful breakpoint features run a program full speed until a loop has been performed n times.

With a single keystroke you can trace an instruction and the action will be immediately reflected in source, object, data, stack, and register windows. Another key begins a special trace mode that executes call and loop instructions at full speed. Designed to work with both Plink[™]86 and MS[®] LINK linkage editors. **\$395.**

iesTM by Phoenix

Get The Lead Out Of Binary File Transfer.

PtelTM is the universal binary file transfer program for MS-DOS 2.0 or higher. You can move binary files fast and accurately. Upload or download groups of files from Bulletin Boards or remote computers. Move files between dissimilar machines and

operating systems. Ptel's advanced binary protocol, TelinkTM offers better-than-Modem7 accuracy and performance. Faster transfer speeds. An on-screen update of error correction, blocks transferred, and transmission time.

Includes popular Modem7 and XModem protocols. With checksum or CRC. Plus Kermit and ASCII. **\$195.**

Maximize Your Program's Efficiency.

PfinishTM delivers the fastest running programs possible. This performance analyzer lets you "zoom in" on the inefficient parts of your program. Whether written in Assembly language, C, PASCAL, FORTRAN, BASIC. Unlike profilers available today, Pfinish understands the structure of your program and reports the amount of activity and time spent in its subroutines or functional groups. Pfinish analyzes both overlaid and memory resident programs. Down to the instruction level. Reports are displayed. Stored on disk. Or printed out. In tabular form or histograms.

Do a dynamic program scan. Identify the most frequently executed subroutines. Find inefficient code that costs your program valuable time. Rank subroutines by execution frequency. **\$395.**

Why Work With A Primitive Editor?

More than a powerful editor, PmateTM is a text processing language. An emulator of other editors. A language-specific editor for C, PASCAL, and FORTRAN. Pmate can even run in the background!

You get full-screen, single-key editing. Ten editing buffers. Horizontal and vertical scrolling. A "garbage stack" buffer. A built-in macro language with variables, control statements, radix conversion, tracing and 120 commands that you can group and execute with a single keystroke. **\$225.**

Why Squeeze Your Program More Than You Have To?

The Plink86 overlay linkage editor brings modular programming to 8086/88-based micros. Write large and complex programs without worrying about memory constraints. Work on modules individually, link them into executable files. Use the same module in different programs. Change the overlay structure of an existing program without recompiling. Use one overlay to access code and data in other overlays.

Plink86 links Intel[®]-format modules. **\$395.**

How do you get your PC to wear many different hats at the same time?

E-Z-DOS-IT.™

Introducing E-Z-DOS-IT™ Concurrent Processing — for IBM PCs and PC compatibles.

Before today, your IBM PC (or PC compatible) could wear only one processing hat at a time. Now, with E-Z-DOS-IT Concurrent Processing, your PC can be an editor, financial analyst, and artist all *at the same time*. And you can be a writer. Or a programmer. In fact, E-Z-DOS-IT is the only concurrent processing system that can run effectively on machines with 256K and up.

Switch from one program to another at the drop of a hat.

With your current system, each time you need to access information on a different disk, you have to save your files, unload and load a program. E-Z-DOS-IT enables you to switch con-

veniently from one application to another instantly. With this easy referencing capability, you can quickly respond to questions, and finish projects significantly faster.

E-Z to use, E-Z to afford.

You'll find it takes only ten minutes to master E-Z-DOS-IT Concurrent Processing. And the suggested retail price is only \$199.95 — improved productivity was never this affordable.

Improved personal productivity at your fingertips.

E-Z-DOS-IT is the one system software package you can't afford to be without. For more information and the name of the dealer nearest you, call toll-free: 800/228-9602 (in California, call 800/423-5592), ask for Operator 1.

Testing 1, 2, 3, 4, 5

New diskette-drive testing programs help users avert problems in read-write operations.

One of the most unnerving moments in the life of a computer user is when he becomes distrustful of diskette drives. Imagine a couple of possible situations:

The professional user of an IBM PC/XT writes a file onto a floppy diskette to take with him for further work on his PCjr at home. Once at home, however, he finds that the jr is unable to read the diskette: a defective drive (its heads are out of alignment) on the XT writes data that it can read, but that other computers cannot. Or . . .

A purchasing manager who has been carefully backing up all of her vendor correspondence on her XT has had increasing difficulties in reading the back-ups. But she puts off having the drive checked out. Then, someone accidentally reformats her fixed disk, wiping out all the correspondence. No problem. She decides to get the floppy drive repaired while the system is down and then restore the back-ups. When the computer comes back, however, none of the back-up diskettes can be read on the repaired drive, even though it is the same drive that recorded the files in the first place.

Users who are unscathed in these kinds of catastrophes are fortunate, but

they should be aware that the time to take preventive measures is before the problem occurs, not after.

Deciding when a drive needed adjustment used to involve much guesswork because some of the tolerances have to be read to 5/10,000ths of an inch and they cannot be seen readily or measured mechanically. The modern 5¼-inch floppy diskette drive and the media that it uses are very forgiving; they allow for the widest possible variations in diskette drive adjustments. By keeping the information density to a conservative 360,000 bytes per two-sided floppy, fairly loose tolerances can be allowed. If, for example, the density were increased to 2 million bytes of information on the same diskette, the adjustments would have to be much more carefully controlled. The effect of the low recording density is that the adjustment quality of the diskette drive is, for the most part, ignored.

Five new diskette-drive testing programs allow users to check the adjustment of their diskette drives. The products offer a wide range of capabilities and varying degrees of ease of use. If the two users mentioned at the beginning of this article had tested their drives with one of these programs, they

TESTING

probably could have prevented their problems from ever occurring.

The diagnostic packages reviewed here are: Recording Interchange Diagnostic (RID) by Dymek Corporation, Datalife Disk Drive Analyzer by Verbatim Corporation, Interrogator by Dysan Corporation, Memory Minder by J. & M. SYSTEMS, LTD., and ReadScope by ReadWare Systems, Inc.

Drives work by spinning the floppy diskette around a hub and accurately positioning the read/write heads above and below. A diskette has either one or two usable sides. Each side has 40 tracks, numbered from 0 (the outermost) to 39, which is closest to the hub. Each track is divided radially, like a pie, into either eight or nine sectors: eight for versions of DOS earlier than 2.0 and eight or nine for versions 2.0 and later. Each sector of each track contains 512 bytes of data, so a nine-sector, dual-sided floppy can store a total of 368,640 bytes of information (generally approximated to 360KB).

A diskette drive has many parameters that must be held within a range of values. The most important are:

Rotational speed. This is recommended to be within the range of 300 RPM, plus or minus 2 percent. If the drive's rotational speed is too fast, written data may be elongated on the track or, in the most extreme cases, the computer may not be able to write all the bits onto a track during one rotation. Conversely, if rotational speed is too slow, the data written will be too compressed for other computers to read.

Centering during clamping. Misadjustment here will cause a circular track to wobble as the diskette rotates. Clamping offset errors will add to track positioning errors, resulting in a combined track alignment error.

Head positioning. This parameter includes the distance away from the diskette surface, distance away from the drive spindle's center of rotation (true track position), angular alignment with respect to the tangent line of a track, and flatness of the head surface with respect to the diskette surface. It also includes measurement of the ability of a drive to relocate a head to the same spot on the diskette multiple times.

Other important parameters are spindle wobble during rotation, vibration of the diskette, and diskette slippage with respect to the hub. Although none of these five drive-testing programs tests every one of these parameters, each performs useful checks. (Note that flatness of the read/write heads with respect to the diskette surface and

rotational vibration are tests that none of these programs performs.)

The secret of how these programs dynamically test a diskette drive lies in their use of a very specially recorded diagnostic diskette with an accompanying program. The data on the diagnostic diskette have been written using extremely accurate equipment in a clean environment. Each data bit is written to a known location, and some bits are written with known positioning errors built in. With a diagnostic program reading from and writing to such a diskette, it is possible to measure diskette drive performance dynamically while the drive is functioning.

This is a stunning marriage of precise mechanisms with digital and analog control and driver circuitry *and* the interpretive software to make it all work. The computer can tell the user exactly which parameter is outside of its specifications and to what degree.

Designers of the five programs have each taken a different approach to the problem of diskette diagnostics: Dymek's Recording Interchange Diagnostic emphasizes ease of use; Datalife by Verbatim emphasizes graphical representation of diagnostic activity; the other three strive for numerical accuracy and versatility in operation. It is difficult to say which will do the best job in identifying a particular drive as marginally acceptable or misadjusted because none of the five states in absolute terms what constitutes an out-of-adjustment condition. The user is advised to refer to the manufacturer's service manual for the particular drive being tested.

TROUBLESHOOTERS

The Recording Interchange Diagnostic (RID) program is the easiest to use; all tests are performed automatically. The user simply installs the single diskette, boots the system with it, and reads the results of each of seven tests. A single diskette contains both the diagnostic programs and the precisely recorded data. Its tests and the limits allowed for each are as follows:

- Speed: 300 RPM +/- 2 percent
- Noise tolerance: (qualitative)
- Write/read: 0 errors, track 34
- Alignment: 0 errors with head at track 16 location +/- 0.002 inches. Also reports clamping error.
- Backlash: (qualitative)
- Clamping eccentricity: clamping plus alignment must not exceed alignment error allowance.
- Erase cross talk: (qualitative)

The RID built-in pass/fail values are not changeable, nor will the program

report any results quantitatively, except rotational speed. Once the program is started, it runs all seven tests automatically (it will not run just one test). The program changes the display mode to 40 columns on the Color Graphics Adapter, which can be distracting. See photo 1 for the pass/fail summary provided by the program.

The program does not print out the diagnostic information by itself; however, since it runs under DOS, pressing Ctrl-PrtSc will successfully write the screen output to the printer, providing the user with a printed record of the diagnostic results.

The principal advantage offered by this program is that it is quick and easy; its main disadvantage is that its output is only qualitative. In addition to the one-page instruction and specifications card, the package includes a 16-page information brochure (printed on three-by-five-inch pages) describing the tests. The program has no licensing restrictions that might prevent its use on more than one computer. RID best serves the user who wants only a quick, pass/fail evaluation of a diskette drive, and for whom graphics and numerical data are not a necessity.

The product by Verbatim, the Datalife Disk Drive Analyzer, also contains its program and precision-recorded diagnostic data tracks on a single diskette. It runs four tests—radial alignment (true track positioning), speed, clamping eccentricity, and write/read—but the user is not informed of the allowed limits. The results are reported as good/fair/poor, but quantitative measurements of drive parameters are not given, nor can the user set or change the program's pass/fail values.

The program includes an autotest option that will run the four tests automatically. Although the program will not print out the information, pressing Shift-PrtSc when the autotest is complete will capture the above diagnostic results onto paper.

A noteworthy feature of the Datalife Disk Drive Analyzer is its excellent use of animated graphics, which depict disk operation during the individual tests. (Photo 2 shows the radial alignment portion of the autotest in progress.) The graphics run only in black and white and provide no numerical data concerning the tests.

The package does not include a manual: all documentation is on a single instruction card. As with RID, this program has no license restrictions to prevent its use on more than one computer. Verbatim's offering is for the user

TESTING

who will trade a precise understanding of the product's test criteria for the opportunity to watch a graphic representation of the drive as it is being put through its evaluative paces.

The Interrogator by Dysan Corporation is a serious diagnostic tool that runs five tests:

- Speed of rotation: 300 \pm 6 RPM
- Centering eccentricity: \pm 0.007 inch
- Radial offset from track nominal center: \pm 0.008 inch, and positive and negative offsets must not vary by more than \pm 0.004 inch
- Azimuth alignment—must read data known to be misaligned to the track tangent line by \pm 42 minutes of arc with no errors
- Hysteresis (positioning repeatability): \pm 0.003 inch

Test results are reported both qualitatively (pass/fail) and quantitatively, with actual measured values for the various parameters. Photo 3 shows the display from the spindle speed test. The user has the option of using Dysan's preset recommendations for pass/fail limits or, if his disk drive's service manual specifies others, he can modify Dysan's limits to match his own hardware. Although Dysan's limits are not claimed to be in compliance with any manufacturer's specifications, Dysan states that the limits it has selected "work well on the machines we have tested."

The testing material for this product comes on two diskettes: one contains the program; the other, called the DDD (Digital Diagnostic Diskette), contains the precision data. In addition to the five tests run with the DDD, the program can support read/write tests to a normal floppy diskette. When used with a Dysan Analog Alignment Diskette (not included with the program), manual seek to any track is provided in the program utilities. This program will produce hard-copy records of the diagnostic results, but it supports only a parallel printer (and since it does not run under DOS, printer output cannot be redirected to either serial port). It is the only product that will run in color as shipped from the factory.

One serious failing of the Interrogator is that even though it resides on a non-DOS boot disk, an XT may not boot the program successfully if DOS can be booted from drive C: instead. If a user's XT normally boots from C:, he must first either erase or rename COMMAND.COM on drive C:. (On my system it is necessary to boot from a floppy diskette containing DOS and restore COMMAND.COM to drive C: after each running of the Interrogator.)

THE INFAX 202

Now You Can Change Your AT's Diskposition!

You bought the IBM PC / AT for its incredible speed, power and expandability. Now, INFAX brings you another advantage — the convenience of two removable disk data cartridges, each with 10 megabytes.

That's right! The INFAX 202 packs your AT or XT with 20 portable interchangeable megabytes. Need 10 more? Take out one data cartridge, slide in another. Whether you're using the 202 for primary storage or for backup, you can have infinite power to spare. And power to go — across the hall or across town.

So, you don't need to put a hodgepodge of applications on a single, do-it-all fixed disk. You don't have to waste time backing up a fixed disk with high priced floppies. And forget about head crashes! The INFAX 202's Bernoulli technology makes them a thing of the past.

The INFAX 202 is a rugged device designed for years of fast, reliable operation, thousands of hours of use have proved this true. It's barely the size of an electronic typewriter yet it drives and houses the same storage capacity of larger, less portable mainframe computers — at a fraction of the cost.

INFAX supplies everything you need to tailor the INFAX 202 for your IBM PC / AT or XT system's exact configuration. In addition to twin disk cartridges (each approximately 8½"x11") and a built-in locking system, the INFAX 202 comes complete with data cable, expansion card and software.

The INFAX 202 is affordable. You can install it in less than 15 minutes. And it's a delight to use because it's user-friendly and menu-driven. So let's give your AT an outgoing diskposition.

PHOTO 4: Memory Minder Quick Test Summary

Memory Minder's Quick Test gives a pass/fail evaluation of the drive; individual tests report quantitative results.

The package comes with an excellent 58-page manual that explains in detail the function of each of the tests, the values of the limits for the parameters being tested, and how to choose and enter replacement values for the limits. Superb diagrams and simulations of the CRT display output are included. The user need not have a technical background in order to understand the manual. The program does not run under DOS, so it cannot be run on PCjr, but a user with a PC or PC/XT might select the Interrogator for its ease of operation and its ability to report both numerical and pass/fail results.

Memory Minder by J. & M. SYSTEMS, LTD. provides the most detailed information of all five systems, but is the most difficult to use. It does not allow changing of the good/fair/poor limits for its automatic test mode, and its individual tests do not report pass/fail results, but require interpretation of the numerical values that are displayed or printed. Furthermore, the values for the limits used by the automatic test cannot be clearly discerned from the program manual. The individual tests all run continuously—the user must terminate each one manually.

This product is contained on two diskettes, one of which is a Dyan DDD. In its Analog Alignment Aid mode, which is not a test but a positioning aid for use with an alignment diskette (not included in the program) and an oscilloscope, the program allows manual positioning of the read/write heads to any track on either side. The tests supported by Memory Minder are:

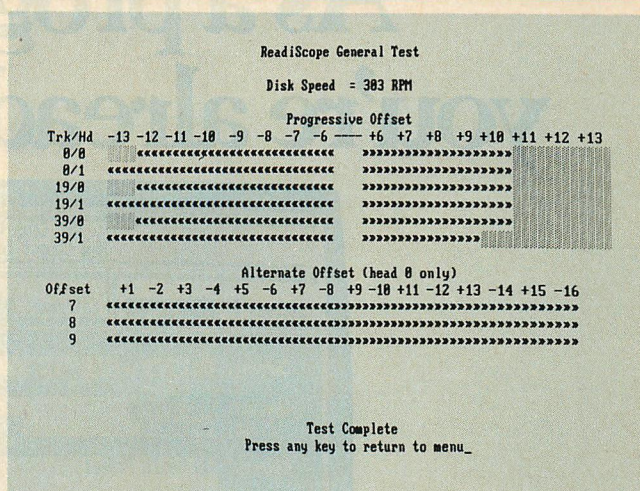

- Clamping eccentricity
- Rotational speed

- Drive sensitivity to head misalignment
- Radial alignment to true track position
- Head rotation off track tangent line
- Directional seek or hysteresis (head repositioning error)

This system outputs numerical data from the individual tests, good/fair/poor information from the automatic test, and a graphical depiction of the results. The screen summary of Memory Minder's "quick test" is shown above in photo 4. It is also the only one of the five products that supports both a parallel and a serial printer for printing of diagnostic results. Its accompanying 42-page, 8½-by-11-inch manual is quite good: it explains all operational aspects of the program and provides an explanation of disk drive operation, as well as a summary of diagnostic approaches to the problems of drive adjustment. The manual is not typeset, however, and is somewhat awkward because of its large size and lack of a vinyl binding.

Memory Minder is not restricted by license agreement to one single computer; for this reason, it will be the program of choice for drive technicians and computer repair operations.

The Readiscope diagnostic package by ReadWare Systems comes on two diskettes and, again, one is the Dyan DDD. But unlike the other two packages that use the DDD, the Readiscope system requires that the serial number of the program diskette and that of the DDD match, otherwise an error message will be displayed. The program does not run in color as shipped from the factory; however the manual includes an explanation of how to patch it for operation in color using IBM's DEBUG. The *Technical Reference Man-*

PHOTO 5: Readiscope General Test

The progressive offset results show a slight misadjustment. A perfectly aligned drive would have a symmetrical pattern.

ual must be consulted to select the color attributes that are inserted in place of the values; this is not a job for a casual user. The tests that are run by Readiscope include:

- Speed of rotation
- Progressive offset (true track position)
- Alternate offset (hub eccentricity and track centering)
- Azimuth rotation (head misalignment to the track tangent line)

Both graphic and quantitative results are displayed, but no pass/fail limits are given, and none can be set by the user. The user can request a sample display of the graphic output that might be expected from either a properly adjusted or a problem drive; this display can be compared with the display from the actual drive under test to determine if adjustment or repair is required. Photo 5 shows a typical display of the Readiscope general test. If the manufacturer's technical specifications for the drive are available, the numeric output from the program can be used to determine quantitatively whether or not a parameter is within the manufacturer's specifications.

No direct printer support is available from the program, but because Readiscope runs under DOS, Shift-PrtSc will output the diagnostic measurements and graphic screen displays to a printer. An extensive 53-page manual explains program operation and diskette drive theory, including an outline of drive repair and diagnostic techniques. The manual also includes several figures representing its screen outputs, and Readiscope's is the only manual with drawings of diskette drives that show the locations where adjustments

With better-looking screens, you could be loved.

You write wonderful programs.

Their logic is elegant. Their organization is solid.
They work like a charm.

But how do they look?

Maybe appearance shouldn't count, but it does.
Because not only is a well-designed screen impressive to look at—it also makes the program easier to work with. And that makes you look good, too.

It takes you days, perhaps weeks of effort to make a program right. Isn't it worth a few minutes to make it beautiful?

A few minutes. That's all it takes for you and Screen Sculptor to create a glorious-looking screen. And once it's done, Screen Sculptor automatically writes the program—in IBM Basic, IBM Pascal, or Turbo Pascal—to display the screen and allow the user to enter data.

There's no limit to what you can do with Screen Sculptor. Design a screen you like and rearrange it whenever you like. Select colors from a mouth-watering menu. Choose special characters, draw lines and boxes, paint in areas, repeat a character in any direction!

Specify input fields, variable names, data types, acceptable data ranges and more. Then Screen Sculptor generates actual program source code based on your screen design.

You'll need an IBM PC, XT, PCjr, PC AT or 100% compatible, 128K, DOS, one 320K disc drive and any 80-column display.

Screen Sculptor does more than design screens. For \$125, it will enhance your creative reputation and thoroughly impress your users.

Because people don't expect a beautiful screen. But they sure do appreciate it when they see it.

Clearly, the RID and Datalife products are "early warning" devices that alert a nontechnical user to a potential

problem; the other products, however, can be used to assist the actual adjustment of diskette drives.

are to be made. The manual is not type-set, but it is contained in a standard vinyl folder that is the same size as most other IBM-family programs.

ReadiScope is the only program that can be run on the PCjr, which indicates that it probably is, by IBM's own definition, a well-behaved program, one that uses only the DOS function calls and does not write directly to either the display buffers or to the diskette drive controller. This program should interest users who are willing to dig out the manufacturer's pass/fail limits for their drive's parameters, or those who own a microcomputer that is almost PC-compatible (like PCjr).

DO-IT-YOURSELF ADJUSTMENTS

Some brave users might attempt to make disk drive adjustments by themselves, although this is generally a job better left to a trained professional. At the least, a competent (and determined) user must have a copy of the drive's factory service manual in hand. ReadiScope and Memory Minder are the only two programs with documentation that includes discussion of drive adjustment techniques (Memory Minder does to a much lesser extent).

As an example, the ReadiScope documentation explains that, rotational speed on the Tandon 100 is adjusted by turning the trim pot on the small circuit board on the rear of the drive. Turning it clockwise decreases the speed; turning it counterclockwise increases the speed. This will not correct for varia-

tions in rotational velocity, but will adjust the average speed in one direction. ReadiScope suggests that if rotational speed fluctuates more than ± 5 RPM, the spindle drive belt could be faulty, or oil could be on the drive pulleys.

A six-step procedure for aligning the heads on the Tandon 100 is also outlined by ReadiScope. To summarize the operation, clamping set screws are loosened enough to permit careful rotation of the eccentric adjustment screw on the rear of the drive to reposition the heads. This adjustment is carried out while the ReadiScope program is running. When the adjustment produces an acceptable display pattern, the clamping screws are tightened.

Using the DDD, even a misaligned hub can be corrected. ReadiScope outlines this procedure as follows: the hub retaining screws at the rear of the drive are loosened slightly to permit some slight movement of the hub assembly. While running the Alternate Offset test, slight manual adjustments of the position of the hub assembly are made until the display indicates that misalignment has been minimized.

These adjustments should all be made in very small increments and with great care, especially on single-drive machines like PCjr, since misalignment problems can be aggravated by misadjustment to such an extent that the drive would no longer function. On a single-drive machine, this would prevent further adjustment of the drive—not to mention use of the machine!

For most users, these five diagnostic programs serve the main purpose—to be able to know or have a good indication *in advance* that a drive requires servicing by a qualified technician. Both ReadiScope and Memory Minder will be of great value to a computer repair shop or a drive technician.

It is unfortunate that none of the programs offers a definitive statement of what constitutes acceptable limits for diskette drive performance parameters. Dysan's Interrogator comes the closest with its default pass/fail values, but even these are prefaced with the statement, "It may be quite sufficient to use the default values set up by Dysan. The default pass/fail limits found in the Interrogator package represent the values we have found to work well with the machines we have tested."

Each of the programs has important advantages, yet each has some major limitations for some users: A disk drive repair technician would prefer the combined numeric and pass/fail output of the Dysan Interrogator. The detailed output offered by Memory Minder makes it a good second choice for the drive technician. The casual user might prefer the ease of operation permitted by Dymek's RID. A user who enjoys lively graphics displays will probably choose Verbatim's Datalife.

The most attractive choice overall, however, is ReadiScope by RSI. Among the features that contribute to this package are its capacity to present its data graphically and numerically, the ability

to output to a printer on either a parallel or a serial printer using PrtSc, and the fact that it can be altered to operate in color. In addition, ReadScope's manual offers the most thorough treatment of the subject, by far; it can run under all versions of DOS released to date; and its use is not restricted by license to a single computer.

Its main program can be copied onto the hard disks of a number of XT computers in a fixed operation, allowing them all to be tested with a common DDD diskette, thus assuring compatibility of read/write operation. Only the DDD diskette would have to be transported from machine to machine; the operating program would remain resident on the hard disk. In addition, it is the only program that can test both an XT and a PCjr. It would therefore be able to prevent the type of problem encountered by the first unfortunate user described in this article. That is especially important to me: I am that user.

Collecting dust instead of data?

No more! Survivability is what you can depend on with HiComp's MBM-500 Bubble Drive.

It's designed to function as a floppy or solid disk drive with boot capability when plugged into any available I/O card slot in your IBM/PC. It's your survival kit in most harsh environments where dust, dirt, extreme temperatures, humidity and vibration are your enemies.

Lost data due to power failures will be history after you install a MBM-500. The device is non-volatile so it can retain memory without battery back-up.

Five times faster than a floppy and 1000 times more reliable the Bubble Drive will prove to be more efficient and effective.

Choose either a 128, 256, or 512-K Byte storage capacity. It's fully compatible with PC-DOS 1.1, 2.0, and newer releases. And it operates on most IBM look-alikes.

Encryption Methods

Part 2

ILLUSTRATION • GARY ZAMCHICK / LEXICA

Public Key Cryptography and the Data Encryption Standard provide effective methods to send secure communications.

VICTOR MANSFIELD

This is part two of a series of articles on encryption. The first part, which appeared in the April issue (p. 96), discussed the fundamental theory of encryption. A future article will review commercial encryption/decryption systems that are available for the IBM PC.

How can secure and unforgeable communication be established between two microcomputer users? Assume that these two users do not trust each other, that their com-

puters are connected to a national network, and that they have had no previous contact. Assume further that both users want to meet security requirements by encrypting their messages.

Two important problems must be solved. First, how should the users exchange keys for the encryption? They cannot simply send them unencrypted over the network, because they know that intruders have access to everything that passes between them. It is possible to send keys by trusted courier, but for

PROGRAMMER'S GUIDE TO CP/M

Edited by Sol Libes

Here's an important collection of CP/M insights that you'll never find in any CP/M manual. CP/M is the most popular microcomputer DOS in use today, and this widespread use has generated many innovative techniques and enhancements of CP/M. *Programmer's Guide to CP/M* tells you what these enhancements are and how to put them to use, how to get around apparent limitations of a CP/M system and why CP/M is far more versatile than you might have imagined. Every article in *Programmer's Guide to CP/M* originally appeared in MICROSYSTEMS between January 1980 and February 1982. Except for this collection, these articles are now unavailable! *Programmer's Guide to CP/M* gives you an in-depth look at CP/M from the viewpoint of the programmer—the individual who creates the software that interfaces directly with CP/M, or who is installing CP/M on systems for which configurations do not already exist.

DATA SECURITY

networks with a large number of users, such as those used by banks and the military, this is impractical; too many keys must be exchanged too often. It would be most convenient to use the network for key distribution, but this must be done securely.

The second problem is being sure that they are really communicating with each other and not with some impostor. The need for unforgeable identity would be crucial if, for example, one of the users were a bank and the other were a customer who wanted to withdraw \$1 million from his account.

This article discusses the revolutionary Public Key Cryptography system and shows just how elegantly both of these problems can be solved. The widely used Data Encryption Standard (DES) is also discussed.

Although much of the sensitive research on encryption is classified, three historical eras can be identified. The first is the classical era, which runs through World War II and involves the various schemes mentioned in part 1 of this series. The second is the era from World War II to 1976; during this period, digital computers became the dominant factor and the DES was devised by IBM and later approved by the National Bureau of Standards for sensitive and commercial data. The third era extends from 1976 to the present. The year 1976 is important, because during that year the public key encryption scheme was devised by Diffie and Hellman ("New Directions in Cryptography," *IEEE Trans. Inform. Theory* IT-22, November 1976, pp. 644-54).

DATA ENCRYPTION STANDARD

IBM developed the DES between 1973 and 1976. This algorithm was approved in 1977 by the National Bureau of Standards for commercial and sensitive data. The approval was initially surrounded by some controversy about just how secure the DES actually is. Military and diplomatic data are handled by systems that are more secure than the DES.

Part 1 of this series explained that modern encryption is fundamentally a series of transposition (or permutations) and substitutions of the plaintext, or unencrypted text. The DES was designed to be conveniently performed in hardware, enhancing the speed and security of the encryption. To that end it is built around the P-box (for permutations) and the S-boxes (for substitutions). A simple P-box shows how a permutation can be done in hardware. Figure 1 is a schematic diagram for the wiring of a P-box.

FIGURE 1: Wiring a P-box

The DES is built around the P-box (for permutations), shown here, and the S-box (for substitutions) that is shown in figure 2.

The P-box's input and output are both 8-bit words. If the input word's bits are designated 01234567 from top to bottom, the bit numbering on the output word for the wiring shown must be 27051364. If a signal enters the illustrated P-box on bit 3, it will exit on bit 5, and so on. If the wiring is changed, a P-box can perform any transposition.

An S-box is made from a P-box in combination with two binary-to-decimal converters, as shown in figure 2. The first decoder on the input side converts a value placed on its 3-bit input lines (which could be an octal number) into one of its eight output lines by setting that particular line to 1 and all of the other lines to 0. The P-box permutes the single bit, and the output decoder converts that one-of-eight value to a 3-bit binary number. In this way, one 3-bit word is transformed into another.

If this process seems too magical, an example may help. Use the P-box wiring shown in figure 1 in the S-box shown in figure 2. If the octal numbers 0, 1, 2, 3, 4, 5, 6, and 7 were input sequentially to the S-box, the output would be 2, 7, 0, 5, 1, 3, 6, and 4. If the P-box shown in figure 1 were rotated so that the input and output sides were interchanged and then used in figure 2, the same sequential octal numbers would become 2, 4, 0, 5, 7, 3, 6, and 1.

With appropriate wiring, any substitution may be performed in hardware. In the DES, these P- and S-boxes are combined to form product ciphers, as shown in figure 3. In this product cipher, 12 input lines are first permuted in P1. The output of P1 is broken up into four groups of 3 bits each. Each group is then subjected to four inde-

FIGURE 2: *Wiring an S-box*

A substitution, or S-box, is made from a P-box in combination with two binary-to-decimal converters that translate a 3-bit binary code into a one-of-eight code.

pendent substitutions in S1, S2, S3, and S4, as described in figure 2. The process is repeated in the following stages.

The DES takes a 64-bit block of plaintext and converts it into 64 bits of ciphertext, using a 56-bit key. A series of 18 different stages is used to do this; these stages employ product ciphers made of P- and S-boxes, like that shown in figure 3. Figure 4 shows an outline of the process. The first stage is a key-independent permutation of the 64-bit plaintext. The last stage is the inverse of the first stage. In between are 16 functionally identical stages designated by i where $i = 1, 2, 3, \dots, 16$. At each stage a unique subkey, $K(i)$, is generated from the original key, K .

As figure 4 shows, each of the 16 stages involves a permutation: the right 32 bits of input become the left 32 bits of output. At each stage i the right 32 bits of input are also encrypted using a function g with $K(i)$. This encrypted 32

bits is then combined by an exclusive OR with the left 32 bits of input and written as the right 32 bits of output. This function $g(K(i), R(i))$ is where all the complication lies and is composed of a series of key-dependent P- and S-boxes, each of which is unique for each stage i . It is so designed to insure the nonlinearity of the encryption process. For the purposes of this article, it is not necessary to describe g in detail nor explain how the subkeys are generated. Interested readers should consult the National Bureau of Standards publication "Federal Information Processing Standards" (Publication 46), which gives the full specifications.

The DES is designed so that decryption is the reverse of encryption. Although the details of the actual steps are quite complicated, the process is actually just a 64-bit key-dependent substitution cipher, because each 64 bits of input are output as 64 bits of ciphertext.

The Missing [Async] Link

... for XT/370, AT/370, and other users
of the IBM 3101 Emulation Program

IBM's 3101 Emulation Program includes a terrific file conversion utility for sending and receiving files over an asynchronous communications link — with compression, cyclic checksums, and efficient 4-for-3 encoding of binary data as printable characters. But it can be used only for PC-to-PC file transfer, because IBM forgot to provide a host system version of this utility! Now WOW Enterprises offers the "missing link": the corresponding utility for CMS and TSO hosts. This produces a micro-to-mainframe link that supports upload and download of arbitrary files for all users of the IBM 3101 Emulation Program. XT/AT/370 users can even transfer program modules and object code over an async line while running under VM/PC. Distributed on diskette, installs easily from the PC.

DATA SECURITY

Since its adoption in 1977 by the National Bureau of Standards, the DES has been implemented in hardware by several manufacturers, so relatively inexpensive and fast encryption is available. The DES is commercially available in software and hardware implementations for the IBM PC.

PUBLIC KEY ENCRYPTION

One of the serious problems mentioned in part 1 of this series is key distribution. In order for systems to remain secure, their keys must be changed frequently. When N is the number of users on a network, each of whom desires secure communications with the $N-1$ other users, the number of pairs of keys that have to be securely distributed is determined by $N(N-1)/2$.

Even modest values of N present problems, because it is hardly secure to distribute a new key encrypted under an old one, which may have been compromised. Or as in the example presented at the beginning of this article: how is the first key to be passed between two users on a network who have never met but who want secure communications? Schemes have been devised to deal with the problem, but they are often awkward and expensive in terms of resources; certainly none is so simple and elegant as the Public Key Cryptography system devised by Diffie and Hellman.

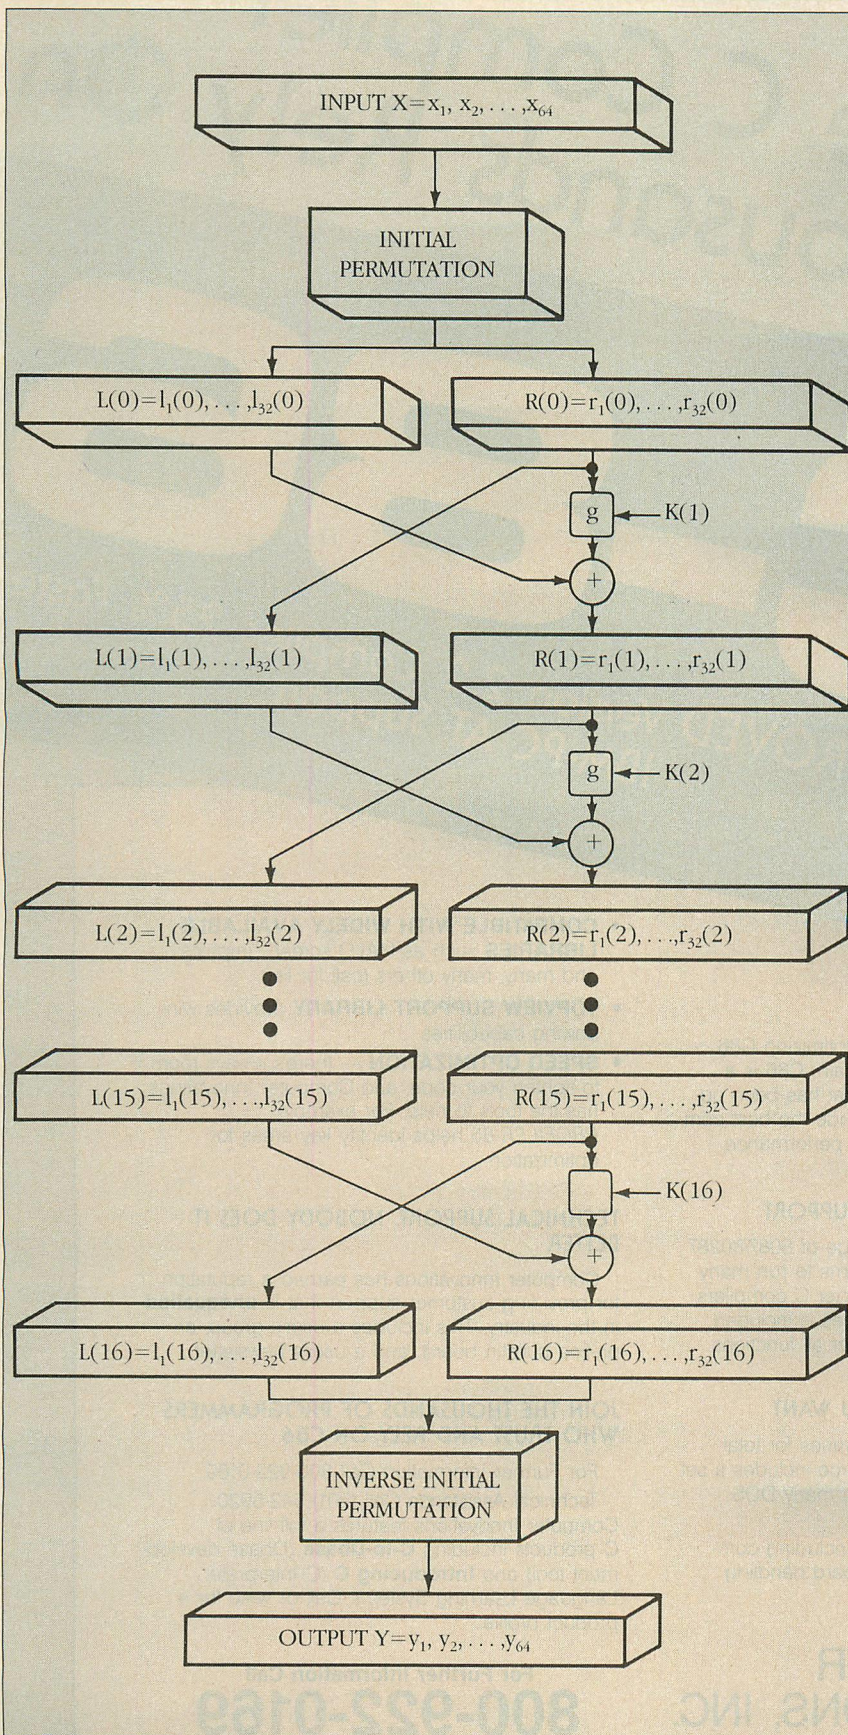

In all encryption systems designed prior to Public Key Cryptography, the encryption and decryption keys are related in some simple way, and both are kept secret. Often decryption is just the reverse of encryption, as is the case in the DES. Diffie and Hellman revolutionized all this by designing a system with two keys: one publicly known encryption key, E , which is published in a directory much like a phone book, and one secret decryption key, D , known only by an individual. In addition, the secret decryption key could be obtained from the public encryption key only with extreme difficulty.

The system is similar to a special mailing envelope that can be filled and sealed by anyone, but that can be opened only by the person whose address appears on it. With this special envelope it is not necessary to worry about the honesty of the letter carrier.

The properties required of the Public Key Cryptography system are explained below. Here, P is the plaintext and C is the ciphertext.

1. $C = E(P)$. This equation says that ciphertext results from encrypting plaintext under the encryption key.

FIGURE 4: Converting Plaintext into Ciphertext

The first stage in this process is a key-independent permutation of the 64-bit plaintext. The last stage is the inverse of the first stage.

2. $P = D(C) = D(E(P))$. This means that plaintext results from decrypting ciphertext with the decryption key.
3. It is exceedingly difficult to find D when E is known.
4. E cannot be broken by an attack in which the intruder can choose the data to be encrypted.

Because of properties 3 and 4, E can be made public. All encryption and decryption keys are generated locally by individuals. The encryption keys are sent to the public directory, in which they can be read by anyone, because they are unencrypted. The decryption key is kept secret by its owner.

Secure communications between two users, Y and M , can be set up in the following manner: first, encryption keys E_Y and E_M are published in a public directory; second, user Y looks up the encryption key for user M in the directory and applies it to the plaintext, P , to get $C = E_M(P)$, which he then sends to user M . User M can decrypt the message by applying user Y 's secret decryption key to find that $D_M(E_M(P)) = P$. Because no one else knows user M 's secret decryption key and because of properties 3 and 4, it is not possible for an intruder to decipher the message.

Thus, the public key encryption system allows strangers to set up secure communications simply and efficiently, without having to solve the problem of secure distribution of secret keys. Compared to other, more difficult schemes that have been devised to accomplish this task, Public Key Cryptography is beautifully simple and direct.

The next challenge is to find algorithms that obey the above criteria. One developed by Rivest, Shamir, and Adleman ("A Method for Obtaining Digital Signatures and Public Key Crypto System," *Commun. ACM*, February 1978) seems quite secure and has been implemented on the IBM PC. Their method is based on principles of number theory. The method is outlined below:

1. Choose two large prime numbers, Q and P , each in excess of 10^{100} .
2. Compute $N = P \cdot Q$ and $Z = (P - 1) \cdot (Q - 1)$.
3. Choose a number that is relatively prime to Z (having no common factors) and call it d .
4. Find e so that $e \cdot d = 1 \text{ mod } Z$.
5. Divide the plaintext P into blocks, B (considered bit strings), so that when each block is transformed into its numerical equivalent ($a = 1, b = 2, \text{ etc.}$) it falls in the interval $0 \leq B \leq N$.
6. To encrypt a message, break it into blocks and compute $C = P^e \text{ (mod } N)$.

7. In order to decrypt C , compute $P = C^d \text{ (mod } N)$.

To encrypt a message, N and e are needed; to decrypt a message, N and d are needed. Therefore, the public key consists of the unique pair (N, e) , and the secret key is d , assuming that N is known. The public key directory contains the user's name, network address, N , and e ; d is known only to that user. The example below will clarify the actual application of this algorithm.

The security of the public key encryption method hinges on the difficulty

of factoring large numbers—if the cryptanalyst could factor the public N , he could then find P and Q and, hence, Z . Knowing Z and e , it is easy to find d using a famous algorithm of Euclid (for determining the greatest common divisor of two integers and, hence, whether two integers are relatively prime). Fortunately for the Rivest/Shamir/Adleman method, factoring large numbers is an exceedingly difficult problem that can consume vast amounts of computer time. According to Rivest, Shamir, and Adleman, factoring a 200-digit number

Are You In **XTC**™ Yet? The Ultimate Programmer's Editor

Some folks have already discovered it. And they threw their other editors away! Why? Because XTC is incredibly powerful. It's also easy to learn, and easy to use. XTC has MORE editing facilities for LESS MONEY — 99 bucks

Is XTC protected? Heck no! We even give you the source on a disk for your recreation — 7,000 lines of Pascal!

JUST LOOK AT THESE LUXURY FEATURES:

WINDOWS — 80 columns wide, independently 4-way scrollable, and non-overlapping. Define 'em the way you want to see them on your screen.

MACROS — Plenty of room for over 100 user-definable macro programs — you can assign 'em to function keys or labels up to 80 characters long!

KEYPAD EDITING — Standard where we come from. But for you mavericks, you can redefine those arrows to do auto-indenting, reformatting, the works! Need Wordstar compatibility? You can use your Wordstar editing commands here.

MULTITASKING — All of your macros can run in the foreground or independently in the background as separate processes while you continue editing.

CONTROL STRUCTURES — We've got everything, including IF THEN ELSE, WHILE, REPEAT, FOR, and BREAK.

EDITOR VARIABLES — Your macros can use plenty of variables to do just about anything. You get INTEGERS, BOOLEANS, and STRINGS, plus...

TEXT BUFFERS — More than you'll ever need — 20 in fact.

INTRODUCTORY OFFER

Want to compare XTC with your editor? Just ask for our demo disk (only \$5.00) and try it out. When you buy XTC, we'll knock five bucks off the price.

XTC outperforms any other program-mable editor on all IBM/PC, XT, and AT computers (and true compatibles). XTC even works with your Sidekick and Turbo Pascal from Borland!

To get your copy of XTC now, order it over the phone — we can ship it the same day! Or, you can send in an order, just like this one:

DATA SECURITY

requires about 4 billion years of computer time using the best known algorithm and a computer that has an instruction time of 10^{-6} seconds.

Although some recent improvements in the methods for factoring large numbers have been made by Simmons and others at the Scandia National Laboratories, the algorithm still seems quite secure. On the other hand, there are some reasonable but unproven assertions in the analysis of the factoring problems, so no complete mathematical proof exists that the algorithm is truly secure. For example, there is no absolute guarantee that some clever person cannot devise an extremely efficient algorithm that would allow large prime numbers to be factored on the IBM PC in, say, 15 minutes. Such an exceedingly unlikely event would then make the system completely vulnerable.

The following simplified application of the Rivest/Shamir/Adleman encryption algorithm will help illustrate exactly how it works. Following the steps given above, choose $Q = 3$ and $P = 11$ (these numbers are considerably smaller than the recommended 10^{100}), which produce $N = 33$ and $Z = 20$. Several choices exist for d , but for simplicity choose $d = 3$, because d will then have no common factor with Z , which is 20. (In this simple case, several other odd numbers smaller than 20 could just as easily have been used.) Next it is necessary to find e so that $e * 3 = 1 \text{ mod } 20$; therefore, $e = 7$.

These values of e , d , and N can be used to encrypt the message *bad*; the numerical value 1 is assigned to a , 2 to b , etc. Making $N = 33$ and restricting the plaintext blocks to single letters from the 26-letter alphabet will satisfy the requirement that the block size be less than N . Table 1 shows the encryption process, and table 2 shows the decryption process.

As this example shows, the Rivest/Shamir/Adleman algorithm works like magic. The computations in this unrealistically simple example are trivial, but in more realistic ones, the computations involved in taking large exponents of large integers modulo for a very large number—for example, $C^d \text{ (mod } N)$ —are demanding. They require full-precision integer arithmetic for integers up to N , which is at least 10^{100} . For this reason, the Rivest/Shamir/Adleman implementation is computationally demanding for machines such as the PC.

One elegant application of Public Key Cryptography involves its ability to provide digital signatures. In the world of paper documents, a unique signature

is often the most important mark on the paper, whether the document is a bank check or the U.S. Declaration of Independence. How can an unforgeable and unique electronic identification be obtained for anyone when the possibility of wiretaps and various other forms of attack is everpresent? When a client tells his stockbroker to buy 1 million shares of stock, how can his stockbroker be sure it is really his client giving the order? If one more property is imposed on the encryption and decryption algorithms, this demand can be satisfied.

In addition to the usual property that $D(E(P)) = P$, the stockbroker (or any other user wanting to be sure that the person communicating with him is who he claims to be) should demand that $E(D(P)) = P$. In other words, in addition to the requirement that text encrypted with the encryption key E be decrypted to plaintext with the decryption key D , the stockbroker should require that text encrypted with the decryption key D be decrypted to plaintext with the encryption key E . When either key acts as an encryption key, the other must act as a decryption key.

Digital signatures are provided in the following way. First, the client uses his secret decryption key to encrypt the plaintext message, P . This produces $D_M(P)$. Then the client finds the stockbroker's encryption key E_V in the public directory and applies it to the result to obtain $E_V(D_M(P))$, which he then sends to the stockbroker. Upon receiving the client's message, the stockbroker applies his secret decryption key to obtain $D_V(E_V(D_M(P))) = D_M(P)$, which he then stores in a safe place. Finally, he looks up the client's public encryption key

and applies it to obtain $E_M(D_M(P)) = P$. If this plaintext message makes sense, it must have come from the client, because only that client knows the D_M that was used for the first encryption.

Now suppose the client denies having ordered the 1 million shares, perhaps because a better investment suddenly came up. The stockbroker can then go to the judge with his copy of the client's message encrypted under his secret key, $D_M(P)$, and the client's message, P . The judge then looks up the client's public key and applies it to $D_M(P)$. He finds $E_M(D_M(P)) = P$, which is identical to the copy of P the stockbroker claimed the client sent; obviously, the client did, in fact, tell the stockbroker to buy the shares.

While they carry the client off to jail he might cry over his shoulder that his private key was stolen and that in fact someone else must have sent the purchase request. Society might rightfully require that theft or suspected compromise of a digital signature be reported immediately in order to avoid responsibility for legal obligations sealed with the signature.

Despite that possible problem, Public Key Cryptography offers a simple and elegant method of providing digital signatures. Other ways to obtain digital signatures are possible with conventional cryptography, but none is so direct as the public key method.

tem can be mathematically proven to be secure; it is secure only because all possible plaintext messages are equally likely for a given ciphertext.

Considerable analysis has been done regarding these two schemes, especially the DES, and although controversy has surrounded the security of the DES, no glaring weaknesses are known for either scheme.

Two general kinds of cryptanalytic attacks can be mounted in order to find the key to a given cipher: analytic and exhaustive attacks. In an analytic attack it is assumed that the algorithm for encryption is publicly known and that only the key is kept secret. An analytic attack derives a set of mathematical equations that expresses the relationship between the plaintext, ciphertext, and key and then solves for the key. Various statistical properties of the language—such as the frequency of individual letters, digrams, trigrams, as mentioned in part one of this series—may also be used to aid in the solution for the key.

The DES thwarted an analytic attack by making the ciphertext such a complicated nonlinear function of the plaintext and key that solving the equations that express their relationship is effectively impossible. The Rivest/Shamir/Adleman algorithm thwarts this type of attack by forcing it to factor very large numbers, an exceedingly arduous job. Recent estimates for factoring large numbers indicate that the computing time required for factoring a 100-digit number, N , on an IBM 370/158 is 8,200 years (Gerver, "Factoring Large Numbers with a Quadratic Sieve," *Math. Comp.* 41, 1983). The factoring time can be greatly increased by increasing N . Because no shortcut methods have been found for factoring large numbers, these estimates are reliable. However, no complete mathematical proof exists that such shortcut methods do not exist; thus, some small doubt remains.

In an exhaustive attack, a particular plaintext with its corresponding ciphertext is known along with the encryption algorithm. Each possible key is used to encrypt that particular plaintext. The resulting ciphertext is then compared to the original ciphertext to see if a match is found, which would indicate that the correct key has been used. This attack may be thwarted by using long keys that give rise to a very large key space. So many keys would have to be tried that the exhaustive search would prove to be impractical.

The Rivest/Shamir/Adleman algorithm uses a key space that is so large

for the size of the numbers suggested that exhaustive searches are effectively ruled out. On the other hand, one of the chief criticisms of the DES is that its relatively small 56-bit key means that there are only $2^{56} = 7.026E16$ possible keys. It has been estimated that by about 1990 a computer could be built for several tens of millions of dollars that could find one 56-bit key per day (Meyer and Matyas, *Cryptography: A New Dimension in Computer Data Security*, 1982). Considering the importance of the data encrypted under the DES, the cost of such a computer is not considered too high.

It is possible, however, to improve the cryptographic strength of the DES by using multiple encryptions with different keys or running it in a stream mode, in which a given block of data depends on the entire encryption history of all previous blocks.

IBM spent 17 years designing and validating the DES and employed several outside consultants. In addition, an independent validation was initiated by the National Bureau of Standards and performed by the foremost cryptographic experts at the National Security Agency (NSA), who approved it for unclassified federal data. Finally, the DES was adopted by the American National Standards Institute (ANSI).

Despite these efforts, controversy has arisen about the DES. Aside from the relatively small key size (which was reduced from the original 128 bits to 56 bits at the request of the NSA for reasons that were not made public), few details are known about the DES. The methods of analysis and the exact design principles used by IBM and the NSA have been classified by the U.S. government. Because this information is not available to a wide spectrum of experts, some claim that IBM's and NSA's statements are unreliable.

Other critics have suggested that an intentional shortcut may have been built into the algorithm to prevent anyone except government officials from easily breaking the code; they claim that this is why the government will not make public the design principles of the S-boxes. This view may seem somewhat paranoid, but in view of possible future developments in the microcomputer revolution, this possibility cannot be lightly dismissed.

For example, consider the possibility that telephones may be connected to microcomputers, which encrypt the data before they go out of the house or office. Then users will be able to send electronic mail or talk with other

people and never worry about any intruders having access to their conversations. Many industries (and criminals) would be happy right now to pay handsomely for such a guarantee.

On the other hand, it is obvious that the various federal agencies, such as the FBI, CIA, and NSA, would not like to be denied the possibility of telephone wiretaps and other traditional means of information-gathering. In addition to the clear needs for prevention and prosecution of crime are serious considerations of national security.

These concerns have prompted the question of whether the talent and industry of American scientists should be openly directed toward the development of secure encryption in such a way that any hostile foreign government could easily make use of it. Such concerns have prompted the U.S. government to ask for voluntary censorship on the part of cryptologists—a request met with little enthusiasm because of the long tradition of open exchange of information in the academic world.

Because of the controversy about the DES, the Senate Committee on Intelligence conducted an investigation into the matter and concluded that, in fact, all was well with the DES. This is of limited comfort to DES's critics, because it amounts to the federal government saying, "Trust me." Given that everything in a cryptographer's training compels him to trust no one, this is a difficult request indeed.

Nonlinear Least-squares Fitting

WALTER SCHREINER, MICHAEL KRAMER,
SIMON KRISCHER, and YEDIDYAH LANGSAM

*A BASIC program uses the Marquardt
algorithm to least-square-fit a set of
data points to a curve.*

Suppose a player wants to know how long it will take to learn a new computer game to a certain level of proficiency. He records his score each time he plays (table 1) and then plots those scores (figure 1). After a while, enough data exist to draw a smooth curve through the points and extrapolate it. He is not satisfied, however, with a hand-drawn curve; he wants an equation to represent the data.

He picks the exponential function

$$Y = a/[1 - \exp(-bX)]$$

because the data look as though they might be reaching an asymptote. Y is the score, X is the number of times the game is played, and the constants a and b are parameters to be determined.

To find values for a and b , the player picks two data points indicative of the trend and evaluates the equation twice. This gives two equations and two unknowns which can then be solved. Unfortunately, none of the other data points that were so painstakingly recorded was used in determining a and b . As a result, the curve goes through the two chosen points exactly, but ignores all the others.

What is really needed in this situation is a least-square fit to all of the points—one that will optimize a and b so that the curve comes as close as possible to every point.

The BASIC program described in this article, MARQFIT.BAS (listing 1), can be used to least-square-fit any func-

tion, linear or nonlinear, to a set of data points. The user supplies the program with the data to be fitted, a suggested function with adjustable parameters, and a set of initial values for these parameters. The program will calculate the best value for these parameters that is consistent with the data and will generate a statistical report of how good the fit is. More importantly, the program has built-in sophisticated plotting routines that allow the user to visually compare his data to the fitted function. This program can be easily modified; it also can be compiled.

Table 1 is an example of a relationship between a dependent variable, Y , which represents experimental data, and an independent variable, X . The

relationship between the two variables can be formalized by saying that Y is a function of X , which is written as $Y = f(X)$. This relationship may be used to predict what the values of Y will be for values of X that are, as yet, unexplored.

The process of optimizing a function that is representative of experimental data is known as *curve-fitting*. Computer programs are not able to decide which function type should be used to fit the data, but they can indicate the best fit for the particular function being used. The computer finds numerical values for the parameters (for example, a and b in the computer-game example above) that are most consistent with the particular data (the "best fit"). If the program has trouble fitting the data, or

if the fit looks poor, another function should be tried.

How does the program decide what constitutes the best fit? It adjusts the parameters until it minimizes the sum of the squares of the difference between Y values calculated from the function and Y values in the data. For obvious reasons, the method is called least-squares analysis. There are many algorithms for carrying out this analysis, but one that is particularly well-suited for general purpose work is the Marquardt algorithm, which—in most cases—finds the solution rapidly.

If the data points are (X_i, Y_i) , where i runs from 1 to N (N is the number of data points), and the function to be fit is $Y = f(X, P)$, where P represents the free parameters, then the sum of squares to be minimized is

$$S = \sum_{i=1}^N (Y - Y_i)^2 = \sum_{i=1}^N [f(X, P) - Y_i]^2$$

To find the minimum value of S , elementary calculus is used to differentiate S with respect to P , set the result equal to 0, and solve for P . When there are several free parameters, (P_1, P_2, \dots) , S must be differentiated with respect to each parameter. A set of simultaneous equations is thus obtained. This calculation can get out of hand, even for simple functions, and an exact solution may not be possible in closed form.

When the function is linear in the fitting parameters (that is, there are no products of parameters or parameters in exponents, etc.), an exact solution to the minimization problem is possible. This situation is called *linear regression*. When there are nonlinear parameters in the function, the equations are generally not soluble algebraically, and nonlinear regression results. Of course, a nonlinear regression program can also be used to solve a linear problem, but it will do so less efficiently.

Multilinear regression is an extension of linear regression, except that instead of one independent variable, X , there are several: X_1, X_2 , etc.

At this point, a common cause of confusion should be mentioned. In dealing with least-squares fitting, it is easy to forget what is varying and what is fixed. When the function is being used to represent the data, X is the independent variable and the parameters, P , are fixed. In the least-squares fitting, however, X and Y are fixed (they are the observed data points, X_i, Y_i) and the parameters, P , are the variables. The terms *linear regression* and *nonlinear regression* refer not to the behavior of

the independent variable X , but to the parameters, P . Thus, the function

$$Y = a + \frac{b}{x} + c \exp(-X)$$

is linear, whereas the function

$$Y = aX^{-b}$$

is nonlinear. The latter function can be linearized by taking the logarithm of both sides and redefining terms:

$$\ln(Y) = \ln(a) - b \ln(X) \\ Y' = a' - bX'$$

Because the proficiency curve $Y = a/[1 - \exp(-bX)]$ is definitely nonlinear, a nonlinear least-squares regression routine is required to fit the parameters.

Regression can be pictured as a surface in a multidimensional space. The parameters, P , are the independent

The typical Marquardt fit begins with S decreasing rapidly while Lambda decreases to the smallest value permitted by local parameter space.

variables and the sum of squares is the dependent variable. The contour plot in figure 2 shows the typical situation for a two-parameter regression problem. The contours are equal values of S as a function of the parameters, a and b . The regression problem is to find the lowest value of S and report the parameters that correspond to it.

To solve a nonlinear least-squares problem, an iterative technique is required. The sum of squares is evaluated for some initial estimates of the parameters, say at point Q . Next, the surface in "parameter space" in the vicinity of this point is examined to find the local curvature. Based on this information, a new set of parameters, say point R , is determined by computing a change vector, ΔP , which is added to the old estimates. Symbolically,

$$P_R = P_Q + \Delta P$$

The process is done repeatedly until convergence is reached.

To compute ΔP , one of several basic methods is employed. The simplest method is to find the slope at point Q and move in that direction. This is called the *method of steepest descent*. If the surface is not cylindrically symmet-

ric, however, this direction does not necessarily point to the minimum. This is the case shown in figure 2, in which the successive iterations move from Q to R to S , etc., and never point directly to the minimum at C . In spite of this difficulty, the direction of steepest descent is always a good one in which to move, if other more sophisticated algorithms fail to produce a ΔP that will result in a decrease in S .

By expanding the expression for the gradient of S in a Taylor series and retaining only the first-order terms, an expression can be found for ΔP that takes into consideration the local curvature. If the chosen function fits the data well, the mixed second partial derivatives can be dropped, giving an expression for ΔP that involves only the first derivatives of the function with respect to the parameters. This is the Gauss-Newton method. Near the minimum, this method gives rapid convergence because of the quadratic nature of the sum of squares in this region.

In the Gauss-Newton method, it is necessary to invert the matrix of data for the independent variables; the possibility always exists that the matrix is singular and, therefore, does not have an inverse. This may result from approximations or computational rounding errors. In any event, the algorithm breaks down, and ΔP cannot be calculated.

In order to circumvent this problem, Marquardt introduced an algorithmic parameter, Lambda, which has the effect of changing the step direction. When Lambda increases, the step direction approaches the steepest descent direction; when Lambda decreases, it approaches the Gauss-Newton direction. The Marquardt algorithm begins with a large Lambda (steepest descent) and decreases it after every iteration. If matrix inversion problems are encountered along the way, Lambda is increased until the matrix can be inverted. In effect, the algorithm takes the most efficient step possible for the current region of parameter space. As the minimum is reached, Lambda approaches 0 and the algorithm converges rapidly with pure Gauss-Newton steps.

Convergence can be defined in one of several ways. Most commonly, iterations are stopped when the fractional change in S is less than a preset value. Alternatively, the tests may be made on ΔP , which must go to 0 at convergence. Both tests may be necessary when the contour in the region of the minimum is very flat or when the minimum is located along the bottom of a steep-walled, slowly curving valley.

FIGURE 1: Proficiency Curve

This curve is the computer-game score, as a function of the number of times it is played. The circles represent data from table 1; the curve is a theoretical fit to the data.

FIGURE 2: Contour Plot

This is a contour plot for the sum of squares, S , for a regression problem with two free parameters. The problem is to find the lowest value of S and the corresponding parameters.

The least-squares convergence problem is easy to visualize in two dimensions, but in three or more it can become nearly impossible. As a result of this, multiparameter fitting can be deceiving. If a relatively flat region of parameter space is encountered, a regression program may appear to have converged, when in fact it may be quite far from the minimum.

Alternatively, the program may converge to a local minimum, while over the next "hill" there is a much better fit. The surface itself also may be sensitive to the errors in the data points, and that surface may change significantly if the data is remeasured. All of these problems are severely compounded if the function that has been chosen does not fit the data well. Care must be exercised, therefore, in using least-squares programs. Knowing how a program behaves under "normal" circumstances is helpful in diagnosing problems.

With the Marquardt algorithm, a typical least-squares fit begins with S decreasing rapidly while Lambda decreases to the smallest value that is permitted by local parameter space. After Lambda stabilizes, S decreases at a relatively constant rate. When convergence is near, S may decrease rapidly to the minimum and Lambda becomes very small. Finally, at convergence, S remains constant and Lambda increases rapidly because of singularities introduced by computational rounding.

Any one or more of these "phases" may be missing, depending on the starting point and the complexity of the

problem. There is also a possibility that the algorithm simply will not converge. In that case, another function should be chosen for estimation.

RUNNING THE PROGRAM

The menu-driven program (listing 1) has been written for an IBM PC with 128KB of memory, using IBM BASIC running under DOS 2.0. Any monitor may be used for running the fitting part of the program, but a color graphics adapter and graphics monitor are required to make use of the plotting option. The following sections outline the procedure for using MARQFIT.BAS.

Before the Marquardt program can be run, two subroutines must be written: one to evaluate the function $Y = f(X_p, P)$ at each data point, X_p , and the other to evaluate the first derivative of $f(X_p, P)$ with respect to each parameter, P , at each data point. The following equations apply to the computer-game proficiency function discussed above:

$$Y = a[1 - \exp(-bX)]$$

$$\frac{\partial Y}{\partial a} = [1 - \exp(-bX)] = \frac{Y}{a}$$

$$\frac{\partial Y}{\partial b} = aX \exp(-bX) = X(a - Y)$$

If the function is so complicated that the derivatives cannot be evaluated in closed form, they can be evaluated numerically. For example,

$$\frac{\partial Y}{\partial a} \approx \frac{f(a + 0.5\Delta a) - f(a - 0.5\Delta a)}{\Delta a}$$

If numerical evaluation is used, how-

ever, care must be taken to choose Δa so that the difference in the numerator is not less than the precision with which f can be evaluated (usually six or seven digits in single precision); otherwise round-off error will cause the results to be meaningless.

The subroutine to evaluate the function must be coded beginning at line 20000 (see listing 1). All of the parameters used in the function should be assigned to the array PARM(30). Thus, in the function

$$Y = a[1 - \exp(-bx)]$$

PARM(1) can be called a and PARM(2) can be called b . In this routine, Y is represented by the variable FUNCTN.

The subroutine to evaluate the derivatives must be coded beginning at line 21000. The derivatives of the functions with respect to each parameter are to be placed in the array DERIV(30) where DERIV(1) contains the derivative of the function with respect to PARM(1), DERIV(2) contains the derivative with respect to PARM(2), and so forth. Once the FUNCTN and DERIV subroutines have been written and included, the fitting program may be run.

The menu provides three choices for entering data: 6, 7, or 16. All data input routines use the string variables T1\$ and T2\$ as buffers. This allows testing for the null string, which signals the end of data entry. When the program requests input for multiple variables, a comma and a carriage return must be entered to terminate data entry.

Choice 6: MANUAL. This choice allows

each point to be entered manually. The program prompts for the entry of each (X(I),DTA(I)) value, which corresponds to an (X,Y) value, until entry is terminated with a carriage return. In the event that some data points are known to be more important than others, the option for entering WGT(I)—weighting factors for each y data value—is also provided. Specific weights, statistical weights (WGT(I) = SQR(DTA(I))), or no weights (WGT(I) = 1) may be chosen. **Choice 7: UREAD.** This choice allows a user-written read routine to be used for

data entry. It is intended for users who have data already stored on disk, either from direct acquisition of experimental data or from some other source. (For example, a routine could be written to import data from a Lotus 1-2-3 file stored in the .DIF format.)

Data may be stored in any number of formats, so lines 1200-1295 have been left empty for users to fill in with their own data-reading routines. The X values are to be stored in X(I) and the Y values in DTA(I). It is important that all WGT(I) values be set to equal 1 (un-

less specific weights are declared). The value of NOBS% should also be set to equal the total number of data points. (When manual data entry is used, these values are all set automatically.)

Choice 16: READ FROM DISK. This choice will read in the values of the data, parameters, and other variables from a file that was stored using choice 14: SAVE ON DISK. This choice will be discussed later in this article.

For the computer-game example, the proficiency-curve data from table 1 were entered manually. For the weights, about 10 percent of the value of the data trend was specified, because this looks about equal to the scatter in the data points. After the information was entered, data entry was terminated with a comma, then a return.

After data have been entered, estimates for the parameters of the function must be provided. This is done with choice 11. The program will then optimize these parameters. Only ball-park values are needed, but the better the estimates, the greater the likelihood of successful and relatively quick convergence. If the program has difficulty (ways to recognize problems will be discussed later), the fit can be interrupted and different starting values for the parameters can be used (more on this later, as well).

Choice 4: PLOT. This choice also can be selected before the fitting routine is run, allowing the user to see how close the initial estimates are. In fact, it is often useful to plot the data even before selecting a function to ensure that an appropriate one is chosen.

In the computer-game problem, the maximum seems to be in the vicinity of 10,000, so $a = \text{PARAM}(1) = 10,000$ and $b = \text{PARAM}(2) = 0$ were chosen as initial guesses. Choice 11:FIX is used to enter the parameter estimates; it also is used to change parameter values or simply to review the current values without changing them.

When these preliminary steps have been performed, the nonlinear least-squares-fit problem can be solved by selecting choice 3:SOLVE. The program prompts for MXITR, the number of iterations to be performed before pausing. If convergence to a solution occurs prior to MXITR iterations, the program prints out the fitting parameters and their errors, along with some statistical data on the fit and returns to the menu.

If convergence is not reached prior to MXITR iterations, the program pauses and prints out preliminary results to let the user reconsider his data and/or fitting function. The user may also inter-

PC Tech Journal Program Listings on Diskette.

THAT'S RIGHT! You don't have to type in detailed program listings from this May issue. You can order them on a LISTING DISKETTE™ from PC Tech Journal. And on the same diskette you'll also receive the program listings for the upcoming June issue.

Certain listings require use of other material (e.g., Pascal compiler). Please consult the relevant article in the magazine.

For your added convenience, we also offer two other LISTING DISKETTES from previous issues. They're all listed in the coupon. To order, simply fill it out. Charge-card customers can also use our toll-free telephone numbers. (Sorry, no C.O.D. or "bill me" orders.)

change parameters, choice 12 or 13 was used to fix or free parameters, or choice 8, 9, or 10 was used to modify data in some way. (One word of caution, however, about parameter values when the program pauses: a current parameter value P with error ΔP does not imply that the real solution is somewhere in the range $P \pm \Delta P$. As in any iterative process, the parameters are just intermediate values that give the current sum of squares.)

The utility of this program lies not only in its ability to fit data, but also in its ability to provide a plot of those data points with the fitted function superimposed. In fact, the program can be used as a stand-alone data- or function-plotting tool without the fitting features. When the plotting routine is run, another menu of choices is presented:

1. Plot data points and the fitted function
2. Plot residuals (Fit minus measurement)
3. Plot % residuals

Choice 1 produces the normal plot, which shows the raw data (plotted as circles) and the function (plotted as a

continuous line). Choices 2 and 3, on the other hand, allow a deeper look at how good the fit is by plotting just the differences (or percent differences) between the original data and the fit.

Three variations of graph style may be used in plotting data: log axes, linear axes, or a combination of the two. The computer reports the range of the data and allows the user to initialize the plot parameters by choosing a range for the X and Y axes. The plot is now defined.

If the graph set-up parameters are satisfactory, the plot may be recreated at any time by pressing F4—the “quick-plot” key. This feature is useful for jumping back and forth between fitting and viewing the data.

At the end of each iteration, the program prints the current weighted sum of squares, S . By monitoring this, the user can tell whether convergence has been reached. In the computer-game example, S decreases rapidly to about 10^{13} . Subsequent decreases in S tend to be small until the solution is reached. The convergence criterion requires that the fractional change in all parameters be less than a preset value.

During the last iteration or two, Λ increases several times while S remains constant because parameter space flattens out near the solution. The number of increases in Λ (INCR) at this stage is printed; this gives a clue to how well determined the solution is. Typically, the better the fit, the more times Λ increases at convergence.

At convergence the program reports the final values for the two parameters, $\text{PARM}(1) = 10,975 \pm 3$ and $\text{PARM}(2) = 0.119 \pm .014$. This function, $Y = 10,975 (1 - \exp(-0.119 X))$

is plotted as the solid curve in figure 1, and the fit seems quite reasonable. The errors on the parameters, however, should not be taken too seriously here, because of the somewhat arbitrary way in which errors (that is, weights) were assigned to the data points.

The ratio of the number of sum-of-squares calls (NSSC) to the number of iterations (NITR) measures the average number of times Λ increased or decreased per iteration. Ratios of about 2 are normal. Higher ratios indicate a difficult parameter space for convergence, but may also appear when convergence is rapid (as in this example). The number of derivative calls (NDC) is also printed, thus providing another indication of how difficult convergence was. The final value of Λ and the final value of the weighted sum of squares are also printed.

This table explains the functions of the most important sections of MARQFIT.BAS (listing 1).

Other fitting statistics that are computed are the standard deviation and chi squared. If the fit is good (if it accounts for all of the systematic variations in the data and only statistical fluctuations remain), the ratio of chi squared to the number of degrees of freedom (χ^2/DF) should be about 1. If it is not, either the model does not account for significant trends in the data or the assigned weights are incorrect.

Errors (that is, weights) should not be assigned to data points arbitrarily. These errors are usually dictated by a knowledge of the various sources of measurement errors, such as counting errors. When these errors are used in the least-squares fit, the value of χ^2/DF acts as a check on the correctness of the measurement errors. In the computer-game example, information about the expected error, other than the scatter in the data points, was not available. Hence, the value of $\chi^2/DF \approx 4$ that was obtained is not unreasonable.

Proper assignment of errors on the data points is important for several reasons. First, unreasonable values can result in significantly different fitted values. For example, assigning $WGT = 100$ to the first seven data points and $WGT = 1,000$ to the rest would result in $PARM(1) = 9,280$ and $PARM(2) = 0.205$, with $\chi^2/DF = 102$. On the other hand, an equal weight assignment of 1,000 to all points gives $PARM(1) = 10,910$ and $PARM(2) = 0.123$ with $\chi^2/DF = 1.5$. Re-

sults are usually fairly independent of weights, if the weights are reasonable.

Second, with correctly assigned errors, a poor χ^2/DF indicates an incomplete fit of the data trends. For example, if the data in table 1 were fit to a straight line going through the origin, ($Y = mX + b$, with b fixed at 0), a slope of 700 and $\chi^2/DF = 18$ would be obtained. Inspection of that fit will confirm the results and, at the same time, reveal the cause: the line goes under most of the data points in the middle.

If the program does not seem to converge, there are several possible causes. First, check the derivative calculations for correctness. That is the most likely place for an outright bug. Next, is the function coded properly? If no problems are found, consider whether the function really describes the data being fitted. If it doesn't, there are likely to be large error limits on the fitted parameter values (often larger than the absolute values of the parameters themselves). This causes convergence to be reached very slowly.

Another possible cause for poorly fitted parameters is that too many parameters were used to characterize the trends in the data. Each parameter should be carefully chosen to represent a specific and unique trend in the data. Poorly fitting parameters and slow convergence result if the data are not able to distinguish all of the variations that the parameters were supposed to repre-

sent. In this case, a fit that is nearly as good can usually be obtained by eliminating or fixing the poor parameters: convergence will be reached faster.

If everything is found to be correct and the problem is difficult to solve because of strongly coupled parameters, the user may possibly induce convergence by fixing several less important parameters (using menu choice 12) for a while, allowing the remaining parameters to converge. Next, free the fixed parameters (using menu choice 13) one or two at a time, fitting to convergence each time, until all are freed.

When difficulty is encountered in reaching convergence, the stability of the final solution should be tested. This can be done by restarting the problem with a different set of initial parameter estimates. If the same final results are not obtained, within approximately the error limits of each parameter, several local minima may be in the area.

BELLS AND WHISTLES

The program has several other features: **Choice 1: ENTER TITLE.** This option is used to document output and data files saved on disk. The title may be up to 70 characters in length.

Choice 2: PRINTER ON/OFF. It is assumed the printer is assigned to LPT1:. When the printer is set ON, all important output is printed on the screen and echoed to the printer.

Choices 8, 9, and 10: MODIFY DATA.

Obsolete technology — it's not just a hardware problem!

You wouldn't dream of wiring your state-of-the-art modem to turn-of-the-century technology. Why strangle your computer with an antique communications program?

NightOwl Software believes your modem should open a window on the world — but without slamming a door on the power of your IBM-PC or compatible. That's why we designed our MEX-PC communications package to allow you complete access to your operating system, utilities and software while connected to a remote system.

Other communications programs limit your on-line options to a small set of built-in commands. Not MEX-PC. Our SHELL feature lets you run your spreadsheet, word processor, database management system, or any other program, from within MEX-PC while you're on-line — and without loss of text or data.

That's a claim no other communications software can make — and it's just one of many reasons MEX-PC is setting new standards for power, flexibility and performance in the world of telecomputing.

Consider the features:

- **A powerful command processor** allows fully automated dialing, log-ons, uploads, downloads and log-offs.
- **A built-in HELP program** explains all aspects of the software, on-line or off. A complete status screen immediately lists all current settings.
- **Command driven.** No need to wade through level after level of menus in a time-consuming search for the commands you want to enter or the features you need to change.
- **Fully documented.** Includes a typeset, ring-bound, 180-page user's manual and complete tutorial, fully indexed.
- **Wide range of protocols**, including Christensen XMODEM with both CRC and Checksum error correction.

Data may be edited with choice 8: individual values or weighting factors may be changed, new data points may be added, or points that are clearly incorrect may be deleted. Choice 9 allows the X and Y values to be scaled by a constant. Choice 10 zeros all data and parameters to begin a new problem. Choice 14: LIST. This option allows the user to review or print all the current data and parameters before or after modifying the data. Function key F3 is used to abort the listing. LIST also displays the Fit Minus Measurement (FMM)

value for each data point, allowing the user to determine which data points (if any) are poorly represented by the fitted function. If the fitted function represents the data perfectly, the FMM value for each point will equal zero.

Choice 15: SAVE ON DISK. This option saves all the current data and parameter values, using the chosen title. The program displays the disk directory of the data drive and then asks for the new file name. It is up to the user to check that the new file name does not duplicate one already on the disk; if it does,

the existing file will be overwritten by the new file. This feature is useful when long fitting problems are concerned. It may be desirable to discontinue fitting, run some other program, and then continue fitting later. Pressing F3 will pause the program after the current iteration, and selecting choice 15 will save the data and parameter values for later use. Choice 16: READ FROM DISK. This option reads back all data stored with the SAVE option. Once the data have been read back from disk, choice 3: SOLVE may be selected or changes can be made to the parameters. If those changes do not improve the fit, it is possible to go back to the saved data and start again.

Table 2 highlights the major segments of the program. The following paragraphs present a sketchy overview of the algorithm found in lines 6000 through 7130. A detailed presentation of the mathematics involved in this fitting routine is beyond the scope of this article. However, for those interested, Schreiner and Jenkins' article in *X-ray Spectrometry* (volume 8, number 1, 1979) and Marquardt's article in *Journal of the Society for Industrial and Applied Mathematics* (volume 11, 1963) provide an in-depth explanation.

As mentioned earlier, the iterative method starts out with an initial set of parameters. For each iteration, a new set of values is calculated by computing the change vector, ΔP , and adding it to the old parameter set. In the program, ΔP is stored in the array named G . This array is found by inverting the following equation

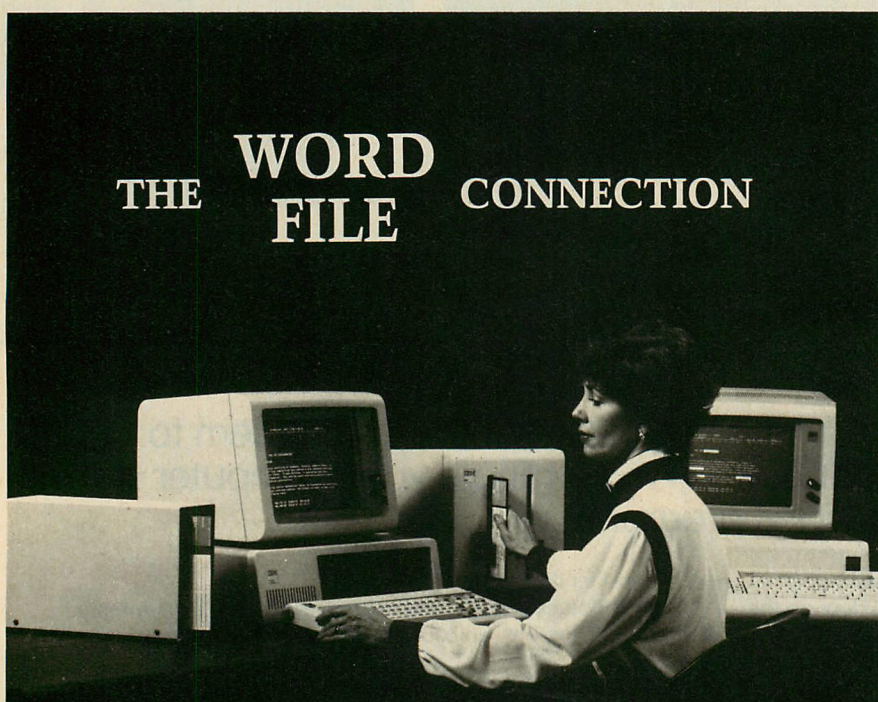

$$A(I) \cdot G(I) = -GRAD(I)$$

where $A(I)$ is a matrix computed from the derivatives of the function with respect to the parameters, $PARM(I)$. $GRAD(I)$ is proportional to the gradient of the sum of squares with respect to each parameter. The values of $G(I)$ are obtained by inverting the matrix, A , and multiplying:

$$G = A^{-1} \cdot GRAD$$

Each iteration executes lines 6240 and 6820. Lines 6550 through 6680 compute the values of $G(I)$, and lines 6700 through 6780 update the $PARM(I)$ values. Convergence is tested in lines 6790 and 6870. If convergence has not yet been reached, the program continues to lines 6830 through 6860 to consider what value to use for Λ in the next iteration. This process is then repeated. When convergence is reached, the program branches to line 6890 to find the parameter errors by in-

verting a matrix; it then computes various statistical functions.

The program allows space for as many as 30 independent parameters and 500 data points. If more than one independent variable, X , is needed, additional arrays ($X1$, $X2$, etc.) of dimension 500 can be allocated. If memory is a problem, the number of data points can be decreased and the variable $MXOBS\%$ can be redefined. Finally, the routine can be used to fit linear functions as well as nonlinear ones. Convergence will be fast, but, more than one step will be required because of the approximations explained earlier.

The original FORTRAN version of the program solved the computer-game problem in three seconds on a Data General Nova 4/X with integer hardware multiply/divide. The IBM BASIC (interpreter) version took 46 seconds. If the program is compiled using the IBM BASIC Compiler version 1.0, this speed increases dramatically to 6.6 seconds. (A further doubling of speed is obtained by adding an 8087 coprocessor with appropriate software support). As can be seen, the compiled program is on a par with a large minicomputer and can be used as a practical scientific tool.

dBASE II

VS.

*Don't let anybody
do a number on you.*

You waited years
for an advanced version of dBASE II.
Without the bugs.
Without the limitations.

It never came.

Instead, you got dBASE III.

A half solution.

A bandage instead of a cure,
so to speak.

Here's what we mean.

As an applications programmer,
you're now supposed to use
dBASE III to write a program on
single-user 16-bit PCs...use dBASE II
to write the same application for
8-bit machines and use heaven
knows what to handle the multi-user
or networked situations.

Contrast that with Q-PRO 4...the
true 4th generation applications
development language for micro-
computers.

Q-PRO 4

Q-PRO 4 handles all the micros ... local area networks (with record and file locking), multi-user, single-user, 8-bit, 16-bit, even the new IBM AT.

The user-friendly applications you write with Q-PRO 4 are fully transportable. They run faster. And you can protect them with our author's lock up package.

Q-PRO 4 is the professional developer's package with no limitations. It runs under PC-DOS, MS-DOS, CCP/M, PC Net, netWare, EtherShare, DNA, CP/M, MP/M, TurboDOS, MmmOST, MUSE, and NSTAR.

And, just in case you don't read reviews or attend seminars, Q-PRO 4 is the one that the computer experts evaluated alongside dBASE II and showed how Q-PRO 4 blows dBASE II away.

	Q-PRO 4	dBASE II	dBASE III

One last word.

If you still write business applications with an old second generation language like BASIC, now's the time to stop ripping yourself off. Q-PRO 4 is the productivity tool that lets you write much better applications in one tenth the time. No exaggeration.

Single-user-\$595; Multi-user-\$795
Complete evaluation system-\$80
Author's lock up available.

Don't dump your dBASE data files, a Q-PRO 4 utility will convert them.

Order Q-PRO 4 now.

MICROWAY'S 8087 RUNS 1-2-3™!

87FFT™ performs Forward and Inverse FFTs on real and complex arrays which occupy up to 512K bytes of RAM. Also does convolutions, auto correlations, hamming, complex vector multiplication, and complex to radial conversions. Callable from MS Fortran or 87BASIC/INLINE **\$150**

87FFT-2™ performs two-dimensional FFTs. Ideal for image processing. Requires 87FFT.. **\$75**

MATRIXPAK™ manages a **MEGABYTE!** Written in assembly language, our runtime package accurately manipulates large matrices at very fast speeds. Includes matrix inversion and the solution of simultaneous linear equations. Callable from MS Fortran 3.2, 87MACRO, 87BASIC/INLINE, and RTOS..... each **\$150**

OTHER TOOLS

Grafmatic for MS Fortran or Pascal **125**
 Plotmatic for Grafmatic **125**
 Halo for Basic, C or Fortran each **150**

 smARTWORK **895**

MAYNSTREAM™ **\$1695**

DFixer

A disk utility which thoroughly checks PC or AT hard disks for bad sectors and updates the MS DOS file allocation table accordingly **\$149**

87DEBUG™ - a professional debugger with 8087 support, a sophisticated screen-oriented macro command processor, and trace features which include the ability to skip tracing through branches to calls and software and hardware interrupts. Breakpoints can be set in code or on guarded addresses in RAM **\$150**

87BASIC/INLINE™ converts the output of the IBM Basic Compiler into optimized 8087 inline code which executes up to seven times faster than 87BASIC. Supports separately compiled inline subroutines which are located in their own segments and can contain up to 64K bytes of code. This allows programs greater than 128K! Requires the IBM Basic Compiler and Macro Assembler. Includes 87BASIC..... **\$200**

RTOS - REAL TIME OPERATING SYSTEM
 RTOS is a multi-user, multi-tasking real time operating system. It includes a configured version of Intel's iRMX-86, LINK-86, LOC-86, LIB-86, OH-86, and MicroWay's 87DEBUG. Runs on the IBM-PC, XT, PC-AT and COMPAQ..... **\$400**

B-TREE SUB-ROUTINES

FABS

Internationally known and used in many best selling application programs . . . Rapid access and maintenance of large files with fixed-length records . . . Versions available for CP/M-80, CP/M-86, MP/MII, MS DOS, PC DOS, Microsoft BASIC(s), COBOL, FORTRAN, PASCAL, PL/I, CBASIC, CB80, CB86, CBASIC, CBASIC 86, LATTICE C.

RETAILS FOR \$150 DEALER/OEM PRICES AVAILABLE

FABS PLUS

Expanded version of our FABS products . . . Up to millions of records DEP on Key Size . . . Extremely fast on unlimited number of keys . . . Re-indexing program included . . . Can be used on files as large as your system can hold.

RETAILS FOR \$195 DEALER/OEM PRICES AVAILABLE

SORT/MERGE SUB-ROUTINES

AUTOSORT

Optimized for very large files; stand-alone or callable sub-routine, extremely fast . . . Versions available for CP/M 80, CP/M 86, MP/MII, MS DOS, PC DOS running Microsoft BASIC(s), FORTRAN, PASCAL, CBASIC, CBASIC 86, CB80, CB 86, LATTICE C.

RETAILS FOR \$150 DEALER/OEM PRICES AVAILABLE

DATA, SCREEN, REPORT MANAGER

DB-FABS

A highly capable DATA BASE package designed to perform for everyone from the novice user in the Stand-Alone mode to the professional programmer in the Run-Time mode . . . Creates files, forms, reports, handles screening . . . B-Tree Indexing, high speed sorting capabilities . . . Run-Time mode use with BASIC INTERPRETER/COMPILER . . . For MS DOS, PC DOS on IBM PC/XT, DEC Rainbow, Victor 9000, Sanyo, Fujitsu, etc.

Can your editor work with 16,000,000 bytes of memory? SPF/PC™ 1.8 from CTC can!

The best full screen editor for the IBM PC is now even better than ever.
It looks and works like IBM's large system SPF editor, but SPF/PC
executes faster and handles larger files than its mainframe cousin.

AT EXTENDED MEMORY
SPF/PC can use up to 15,850 KB of memory.

TOP VIEW COMPATIBLE
SPF/PC supports windowing and
background execution.

COMMUNICATIONS FEATURE
Easy to use communications software.

Professional Lab and Business Graphics Software for Your IBM* PC

SCIENTIFIC PLOTTER-PC—

Draws professional graphs of your data. Line or scatter plots, semi-log or log-log plots, bar graphs, exploded pie charts, stock charts with high, low, close. 320 x 200 resolution in 4 colors. Automatic or manual selection of axis length and position, tick marks and numeric labels. Features 20 plot symbols, error bars, multiple labels in 4 orientations and versatile printer hardcopy. Format and data files may be saved on disk. Includes 11 demos on disk plus manual \$ 95

CURVE FITTER-PC—Select the

best curve to fit your data. Scale, transform, average or smooth, interpolate (3 types), least squares fit (8 types), evaluate unknowns from fitted curves. Features auto-scaling, statistical evaluation of fitted curves, multiple labels in 4 orientations, and versatile printer hardcopy. Format and data files may be saved on disk. Includes 5 demos on disk plus manual \$ 95

GAUSS™

MATRIX PROGRAMMING LANGUAGE

GAUSS is a sophisticated matrix programming package that lets you do large scale number crunching on an IBM-PC.*

- **EXTREMELY FAST.** Uses the 8087. Is 10-15 x faster than IBM APL.
- **STATE-OF-THE-ART** numerical routines and random number generators.
- **FULL-FEATURED.** Excellent for statistics, for simulations, for solving non-linear simultaneous equations, and for anything else requiring number crunching.
- **EASY TO LEARN.** Lets you write routines almost exactly as you would write them mathematically.
- **POWERFUL.** Write complex numerical routines in a fraction of the time and with a fraction of the code they would take in Fortran, Basic, or even APL.

FORLIB-PLUS™

Contains three assembly coded LIBRARIES plus support. FORTRAN coded subroutines and DEMO programs.

The three LIBRARIES contain support for GRAPHICS, COMMUNICATION, and FILE HANDLING/DISK SUPPORT. An additional feature within the graphics library is the capability of one fortran program calling another and passing data to it. Within the communication library, there are routines which will permit interrupt driven, buffered data to be received. With this capability, 9600 BAUD communication is possible. The file handling library contains all the required software to be DOS 3.0 PATHNAME compatible.

Know Thy PC!

Are you writing programs in BASIC or Pascal? The popular **Peeks 'n Pokes** has a disk with 58 programs and a 38-page manual that helps you get 'underneath the covers' of the PC. Learn how to use PEEK, POKE, INP, OUT, and DOS/BIOS function calls to do what you want, fast! Do you want to perform functions not available from BASIC or Pascal? It's all explained in the manual and demonstrated in the sample programs. Source code included!

Peeks 'n Pokes shows you how to:

- Access the system's configuration
- Unprotect BASIC programs
- Scroll part or all of the screen
- Access the file directory
- Logically swap printers
- Read and change the keyboard
- Find more Peeks and Pokes
- And much more... for only \$30.00

Want to know more? **The Inside Track!** is a collection of advanced utilities for the PC programmer. It contains a disk with 61 programs, a 42-page manual, and a fold-out memory map that helps you get better performance from the PC. With this package you can give your programs assembler-assisted speed from high-level languages, get control over memory, customize and control the PC, and more. Some programs require DOS 2.00. Source code included!

The Inside Track! shows you how to:

- Read/write files as fast as DOS
- Display data on the screen faster
- Reserve memory for your use
- Copy memory to another location
- Copy-protect your programs
- Load large programs faster
- Control the keyboard settings
- And much more... for only \$45.00

YOUR BUSINESS COMPUTER IS HIDING OUT WITH THE CIA

And there's a good reason for it.

You see, AT&T recently redeveloped the business computer. The new AT&T 3B series is much more compact and easier to use than the old style business computers. The 3B series doesn't need any special computer rooms or air-conditioning systems and it can be placed, ready to go, into nearly any office environment.

But, the one thing that the mighty B's have in common with their ancestors is capability. They all use the AT&T WE™ 32000 microprocessor, the industry's first true 32 bit chip in a system this size. More important, the 3B series is designed to optimize the UNIX™ operating system—which only makes sense, because AT&T invented UNIX.

Now, you've probably guessed that a computer line with this much going for it would only be found at a computer dealer with a lot going for him. That's why your 3B is waiting for you at the CIA.

CIA is Computer Integration Associates. We're one of the few value added resellers nationwide that AT&T has selected to handle the 3B series.

We've got the technical expertise that the 3B's demand, and the support team to back them up. In fact, Computer Integration Associates is an expert at setting up computer systems for businesses of all sizes with applications specialties in accounting, manufacturing, legal, medical/dental and financial systems.

Our PC and Subsystems Division can assist you in upgrading your existing PC systems as well. CIA can provide solutions to all your business computing needs.

So when you're ready to take a look at the 3B Computer, or upgrade your existing system, you know what you have to do. Look them up at their only local hideout: Computer Integration Associates.

Tired of waiting for your PC?

DOUBLEDOS DONBREDO2

Multi-tasking, concurrent processing using today's software and your PC, XT, or AT system!

No matter how good your PC is, you still have to wait while it processes and calculates for a long report, spread sheet, payroll, or whatever. This waiting is costing you time and money.

Now, DoubleDOS, the remarkable new software, lets your PC actually run programs concurrently!

Think of the ways DoubleDOS will save you time and money:

- BUSINESS. Run a spreadsheet, and at the same time, print the payroll checks or accounting reports.
- WORD PROCESSING. Work on another document while printing or spell checking previous work.
- PROGRAMMING. Compile programs while starting new ones immediately.
- COMMUNICATIONS. Receive or send information while you use the PC to do other tasks. DoubleDOS has endless applications! But it's easy to use.

DOUBLEDOS DONBREDO2

End the wait! Now DOUBLEDOS DONBREDO2

Offers you more useable features!

- You have the option to control the multi-tasking functions with your own programs!
- Faster displays than DOS!
- DoubleDOS multi-tasking requires only 18-40K RAM!
- Built-in printer buffer!

Listen to what users are saying about DoubleDOS:

- "It lets me get more done. Lotus and Dbase run together like they were made that way and it only takes 30K in RAM!"
- "Excellent. Just what we needed for our applications!"
- "It does seem to perform as advertised and seems to be professionally done."
- "I like this product. Already found it very useful."
- "Great product! It is solid, painless, and bulletproof."

System/34 for the Microcomputer

BABY/34 transports the System/34 minicomputer operating environment to the PC, PC/XT, and PC/AT.

ROBERT SANFORD

The operating environment of the IBM System/34 minicomputer is now available to IBM PC users via a new product from California Software Products, Inc. BABY/34 is a fairly complete software system that transports most of the IBM System/34 environment to the PC. It is designed to match the System/34 in the use of the RPG II compiler (see sidebar), OCL (Operation Control Language), SORT, SEU (an editor), SFGR (Screen Format Generator), and DFU (Data File Utility). With BABY/34, users who are familiar with the System/34 can rapidly and easily move their programs to the PC.

Because of this complete environment, the minimum machine configuration is a PC with 256KB of memory, DOS 2.0 or later, a parallel port, and two 360KB drives. A hard disk is highly recommended. The latest version of the system (version 2.2) also has been tested on the PC/AT and DOS 3.0.

The RPG II compiler is written in Pascal to make it easier to modify to keep current with new IBM development. An OCL interpreter is included to interpret each line of control language as is done on the System/34, and a sophisticated sort facility allows data sorting exactly as a System/34. The only major program that is not available is the Screen Design Aid. Specifications for a screen are entered using the editor.

The package that arrives from California Software Products includes two

thick binders, a documentation update, five diskettes, and a software protection device. The first binder contains the RPG II and DFU reference manuals. The second one covers installation, OCL,

SEU, DEU (Data Exchange Utility), and SORT. Also included is a concise summary of the key differences between the System/34 RPG II and BABY/34 implementation (see accompanying sidebar).

The documentation is very complete and well cross-referenced. Each section contains appendices with docu-

mentation of the runtime messages and other reference information.

The instructions for the software protection device are quite clear. It plugs into the parallel printer port, and the printer plugs into it. This device is supposed to be transparent to the system, nevertheless the user is warned not to send bit-mapped graphics to the printer while using BABY/34. The software protection device eliminates the need to copy-protect the diskettes.

Installation of BABY/34 on a PC/XT also is explained clearly and in some detail in the documentation. After the first diskette is inserted, the user types "INSTALL <drive letter:>." A menu is displayed asking for the diskette drive ID, the hard disk ID, and the subdirectory in which the programs are to be placed. After entering this data, the proper subdirectories are created, and the system is copied and verified.

The system occupies about 1.3MB, but much of that is unnecessary code. For example, the source code for the screen editor formats is included in the event that the user wants to modify them. The installation section appendix has both tailoring and sizing considerations to enable a user to shrink the system to the minimum configuration. BABY/34 can be run on a PC with floppy disk drives alone, but this is not recommended for development.

Disk organization in System/34 is different from a PC. In the System/34,

libraries are special files that contain programs (called *members*). Data files and libraries share the disk in a single directory. BABY/34 emulates this by putting all data files in the \RPG subdirectory and creating additional subdirectories for the System/34 libraries. This is a very workable solution.

PROGRAM CONVERSION

Conversion of System/34 from one machine to another is a large task. First the programs and data must be physically moved to the new machine and reformatted to the target machine requirements. If the target machine uses different character representation, appropriate translation must be done to both the source code and the data files. All programs must be modified if the code is dependent upon the character representation. This last step can be a huge investment in programmer time, unless the compiler does the conversion internally. The Baby/34 compiler was written with character set conversion in mind and handles most ASCII/EBCDIC differences by internally converting some items to EBCDIC, doing the operation, and converting to ASCII. The documentation shows which items are handled by the compiler, and which must be analyzed by the programmer.

BABY/34 was tested by transporting a major system containing more than 100 RPG programs, 50-plus screens and menus, and related procedures. First, the libraries were transported from the System/34 to the PC. Since a library on the System/34 is a file containing multiple members, it must be brought to the PC, split into multiple source files, and converted from EBCDIC to ASCII. The DEU documentation explains clearly the steps to be taken on the System/34 to build the diskette files.

The editor, SEU, has a flaw in file recovery that will annoy System/34 users who are used to that system's strong file recovery capabilities.

For this test, a Flagstaff Engineering eight-inch diskette drive was attached to the PC. DEU automatically splits the source file into multiple members and converts to ASCII. It also determines if the source member is a screen or an

RPG program and attaches the appropriate suffix to the resulting file on the PC. All of this is done without any user effort. DEU also simplifies translating data files from EBCDIC to ASCII. As each file is translated, DEU asks for the conversion requirements. All fields except packed decimal and binary should be converted to ASCII. The conversion requirements are easy, but a help screen is available if necessary.

At this time in the testing process, more than 100 source files needed to be recompiled. To speed this process, a directory of the source members was run, the output was redirected to a data file, and an editor was used to set up a large procedure, or batch, file. OCL started the runtime interpreter, called the procedure, and the OCL interpreter was left to run on its own overnight. It read the procedure, ran the compiler and screen generator, and produced runtime programs and listings. The next morning only a few programs had failed to compile and the errors were easily identified and corrected.

Next came the test: would BABY/34 run the System/34 RPG II programs on a PC? Yes. However, when the data were keyed the carriage return key did not perform as the Field Exit key of the System/34; it worked more like a New Line key. According to the documentation, BABY/34 handles the keyboard either way. If KEY5251 is put in the AUTOEXEC.BAT file (or entered prior to entering the BABY/34 system) BABY/34 remaps the keyboard to the familiar IBM 5251 terminal keyboard.

BABY/34 has some very nice capabilities in addition to transporting programs from System/34. SEU, DEU, the RPG II compiler, and SFGR may also be called from DOS. In addition, DOS.BAT files may be executed from within the OCL interpreter. If the interpreter cannot find a file with the .P suffix, it looks for a .BAT file with the same name but preceded by a "\$". If it finds this file, it executes it as a DOS batch file and returns automatically to the interpreter when finished.

OCL can be called from within the interpreter. This is similar to calling COMMAND.COM from within COMMAND.COM. The interpreter loads another copy of itself. When signing off of this level, the user is returned to the previous level. Although this is not considered a bug, each time the interpreter is loaded, 65KB is used up.

Screens do not automatically clear at the end of a procedure in BABY/34. This can also be circumvented, but is annoying and not System/34-standard.

The editor, SEU, has a flaw in file recovery that will annoy System/34 users who are accustomed to the strong file recovery capabilities of that system. SEU automatically builds two work files while editing. One contains the original lines of code; the other contains any added lines. If the program ends unexpectedly, SEU will attempt to recover these files the next time it is called. A disaster was simulated by rebooting. The file had been added to the directory, but since it was not closed correctly, the data were lost. CHKDSK /F was used to recover the data. This is really a DOS problem rather than an SEU problem. Since this is not part of the normal operation, it did not pose a serious problem, however.

Apart from minor annoyances, the BABY/34 system seems very robust and easy to use. Errors are handled gracefully, and nothing in normal operation caused the system to crash. The documentation is very good and the technical support outstanding. Designing a compatible compiler and operating system that simulate another compiler and operating system working on a different computer is an exceedingly difficult task. As the other vendor releases new enhancements and changes its standards, the package must be updated. In addition, as more and more programs are brought across to the PC environment, more bugs are found that are traceable not to errors in how the compiler works, but to differences in the way the compiler handles various default conditions. Many times these defaults are undocumented features in the original system. By using these features, the programmers may make their own code nonportable to other machines.

California Software Products seems committed to enhancing BABY/34 as necessary to keep it current with the System/34 line and to resolve conflicts with the IBM standard. Currently, there are more than 3,000 registered users of BABY/34. Although this product is not a complete implementation of the System/34 environment, it is more than enough to make the transition from the System/34 to the PC a fairly easy task.

Pricing of BABY/34 depends upon user requirements. The runtime-only package is \$650. This does not include the DFU execution module, which is available for \$150. A runtime system with SEU, DEU, and DFU is \$1,650. A development system that includes everything except the DFU program generator is \$2,700, with the DFU generator available for an additional \$600. All of these prices include a full year of

maintenance support from California Software Products. Although these prices may seem high, the cost of re-programming existing IBM System/34 software in another language for the IBM PC would be far higher.

BABY/36 is undergoing final product review and should be available by the time this article is published. It incorporates all of the BABY/34 functions plus expanded functional support of unique System/36 features. Pricing will be similar to that for the BABY/34, beginning at \$700 for the runtime-only

version with DFU. A development system with everything will be \$3,500.

The BASIC idea.

Now it's even better.

True BASIC™

A new, more powerful version of the world's most widely used programming language—created by the original developers of BASIC, John Kemeny and Thomas Kurtz.

True BASIC is still easy to learn and use yet offers the following advanced features:

- **WINDOWS**—True BASIC allows you to program multiple screen windows, each with its own parameters.
- **SPEED**—Because True BASIC is compiled, it is faster than interpreted BASICs. Automatic 8087 support is standard.
- **STRUCTURE**—True BASIC allows you to write modular programs. It supports advanced control structures such as SELECT CASE, IF-THEN-ELSEIF, DO Loops, etc.
- **EXTERNAL PROGRAMS**—Increase your programming efficiency by storing frequently used functions and subroutines in user-defined libraries. True BASIC supports calls to assembly language subroutines.
- **FULL MEMORY**—With True BASIC you can use all the available memory in your computer.
- **SUPERIOR GRAPHICS**—Allow you to draw in your own coordinates, not in terms of pixels. Animation, sound and color are supported.
- **IMPROVED ERROR CHECKING**—Compiler reports syntax errors before running a program. The language incorporates user-defined error messages.

Now available for the IBM PC. Apple Macintosh available Summer, 1985.

THE STRENGTH OF RPG II

At first glance the RPG II programming language seems obsolete, cumbersome, and decidedly not state-of-the-art. Nonetheless, most of the IBM Systems /3, /32, /34, and /36 today still use RPG II as their primary language. Since hundreds of thousands of these machines are in use, RPG II has become a major language. The overwhelming success of the System/3, followed by the Systems /32, /34, and /36, gave RPG II credibility. In addition, the standards have always been rigidly defined by IBM.

The RPG II programming language began originally as the Report Program Generator on the IBM System/360 in the 1960s. At that time the language was easy to use, but limited to producing batch reports. When the IBM System/3 minicomputer line was introduced by the General Systems Division in 1969, the language was extensively modified and enhanced to become RPG II. It was also the only language available on the System/3. As the System/3 line was expanded, the language was further enhanced with new features and functions for the new machines.

An advantage to using RPG II is that a new programmer can produce dependable working code in a far shorter time than almost any other language. RPG II moves most of the housekeeping functions from the programmer to the compiler. A general logic cycle is automatically built to include opening files, reading records into buffers, moving data between buffers and fields, writing buffers to disk, and closing files. This frees the programmer to concentrate on calculations, rather than design.

RPG II has a series of very powerful indicators (flags), some of which are automatically controlled by the internal logic of the program; others are left for use by the programmer. They may be used to control which record to read next, which fields to bring in from the buffer to the work area, which fields on the screen to reverse-image, or which fields to write to disk. An indicator may be set as the result of an operation and determine whether a line code is executed hundreds of lines later.

The programmer also is helped by a series of coding sheets. Unlike other coding sheets, these are unique to the data required. Information about files is filled in on a file specification sheet and calculations are written on a calculation sheet. Because of these specification sheets, the source input is not free-form. For example, the programmer must put an *F* in column 6 of the file spec sheet. The file name must begin in column 7. The source must be entered in the correct order. Program header specifications must be first, followed by file specs, input specs, calculations, and finally, output specs. This rigidity leads to frustration (and derision) from programmers migrating to RPG II from other languages and is part of the reason RPG II is held in low repute. This rigidity, however, makes the source listings far easier to read and debug.

The standard RPG II logic cycle is quite simple. The program reads a record, does calculations, and writes a record. This repeats until no more records exist for that file. The cycle starts again with the next file listed. The programmer can short-circuit this at any time by turning on a special indicator to signal end-of-job. In truth, the logic cycle is much more sophisticated than this. Records may be read alternately from two files. In addition, output may be performed if a *level-break* has occurred. This allows the programmer to print totals and clear work fields automatically if the contents of a field change.

The logic cycle works on records rather than fields. This record may be a disk record or a record from a workstation (CRT) or some other device. A record from a workstation may be a full screen of data, rather than a single keystroke. The programmer does not have to contend with the character or field I/O, only with record I/O.

The programmer may deviate from the normal logic cycle. For example, the cycle may be interrupted to get data through a READ or a CHAIN command. The READ operation gets the next sequential record, while the CHAIN operation gets an indexed or direct file record based upon a key value or record number. Normal output is modified through the EXCPT operation. This allows the programmer to interrupt the calculations, write a record (or display a message), and return to the next line.

Since all records in RPG II have fixed field and record lengths, the language supports three basic types of disk files: indexed, direct, and sequential. In addition, a file that is created as indexed may still be accessed as a direct or sequential file. This gives the programmer flexibility in approaching any new task.

The strength of RPG II on the System/34 is enhanced by a complete system support structure that includes a full range of program utilities, a control language to control scheduling and execution of programs, a screen design aid, and a program editor closely tied to the language.

BABY/34 DIFFERENCES

SSP/OCL—SYSTEM SUPPORT PROGRAM/OPERATION CONTROL LANGUAGE

- The major difference between BABY/34 and System/34 is one of single-user versus multitasking. BABY/34 has no job queue and no ability to evoke a task. Tasks placed in the job queue or that are evoked will execute immediately. Neither does BABY/34 have a background "server" task. System/32 users will be familiar with this ability.
- Most of System/34's utility programs are included in BABY/34; others can be duplicated using DOS.
- Some OCL statements and parameters are not applicable. A configuration option allows these statements to be ignored if encountered.
- Periods in file names on the System/34 are changed to an underline character on BABY/34.
- Group files are not implemented on BABY/34.
- Data must be passed as OCL parameters and not as data.
- Data may be passed to the program through the local data area or through the PROMPT function.

SEU—SOURCE ENTRY UTILITY

- The Home key will backspace only if the cursor is in the first position of the screen. Since this field is almost always an auto-dup field, this function is not usable much of the time.
- Syntax checking is not implemented in BABY/34. A help capability is, however, that displays the required data for each field in the current format.
- BABY/34 has no ability to access members in other libraries. Members must be in the current library.
- No special action is taken at EOJ for procedures.
- The INSERT key to BABY/34 does not put the terminal

into insert mode, but merely shifts all of the data in that field to the right one position.

SORT

- The collating sequence is ASCII, so an alternate collating sequence statement may be required in BABY/34.
- Sorts based upon bit values or zone/digit may be different because of ASCII.
- A maximum of 65,535 records may be sorted in one file in BABY/34.
- Sort requires an input record length in the header specification if the output length and input length are different (because DOS does not supply this information).

RPG II

- Since BABY/34 data are in ASCII instead of EBCDIC, some programming changes may be required. BABY/34 does some runtime conversions automatically, so changes are far fewer than would be required to convert to another RPG compiler using ASCII. An example of conversion required is a TESTB (test bit) operation on a numeric field to determine the sign. This could be changed to Z-ADD to make it compatible with both ASCII and EBCDIC. The system automatically converts characters to their EBCDIC equivalent for testing in cases such as MOVE and input record selection. The BABY/34 manual is very helpful in showing programming that must be examined.
- Inquiry is not supported.
- BABY/34 ignores program identification in column 75. The object name is the same as the source name.

- Delete-capable direct files are not supported.
- Indexed files are always IFILE type. Keysort is not required and added index entries are available.
- BABY/34 has no communications support or special device support.
- The EXIT opcode is limited to SUBR21 and SUBR23. BABY/34 cannot link to user-written subroutines.
- The DEL operation in the output specification is not supported.
- ACQ, POST, NEXT, and SORTA are not implemented and produce compiler errors in BABY/34.
- RUF (read under format) is supported, but not very usable in a runtime system. When a program terminates, keystrokes are kept in an internal buffer and not written to the screen until the next program is loaded. Thus, there is no operator feedback. This is acceptable for testing and debugging.
- BABY/34 has no AUTO REPORT capability.
- There is no capability for MRT or NEP programs (since the operating system is single-user).

SFGR—SCREEN FORMAT GENERATOR

- SFGR works like it does in the System/34 with the exception of some display attributes not available on the PC. The Screen Design Aid (SDA) is not available.
- Fields on the screen are limited to 80 characters.
- Column separators are emulated with underline.

DFU—DATA FILE UTILITY

- All functions work as they do on the System/34.

Pascal Bugs

Both IBM and Microsoft Pascal compilers suffer from some serious bugs, but the user can work around them.

TED FORGERON

During the two and one-half years between the release of IBM Pascal version 1.0 in August 1981 and version 2.0 in March 1984, Microsoft released, on the average, one new version of the compiler every six to nine months. It's no secret that Micro-

soft developed both versions of the IBM Pascal compiler, but because IBM does not have the exclusive marketing rights to the compiler, Microsoft's enhanced, intermediate versions were available to the public before the equivalent IBM version was released.

Sometimes, however, it pays to wait. The Pascal compiler has at least five serious bugs. Four involve support for floating point (REAL) numbers and one involves double-word (INTEGER4) integers. The most serious bug of the five prevents Pascal programs that use

real numbers from running on the PC/AT. Because IBM subjected the compiler to additional, intensive testing after taking delivery from Microsoft, at least two of these problems, which exist in MS-Pascal 3.2, are not present in the equivalent IBM Pascal 2.0.

But even IBM is fallible. Two of the more fatal bugs described in this article exist in IBM's latest version as well.

All of the bugs described here were tested on four different versions of the Pascal compiler: IBM versions 1.0 and 2.0 and Microsoft versions 3.13 and

3.2. For IBM Pascal version 1.0, the test programs were linked with the standard PASCAL.LIB. For the three newer Pascal compiler versions, the test programs were linked with their respective 8087 emulator math libraries.

Bug 1: Extra parentheses. Some programmers like to use extra parentheses to make their code more readable. However, extra parentheses enclosing expressions that include variables of type REAL8 may produce surprising results.

Listing 1 contains a program called BUG1 that displays the output of several

The test cases using REAL4 are correct, but using type REAL8 with extra parentheses produces incorrect results.

Here is what happens when x is not passed as a parameter:

exp(x) = 2.98562378E+014

sin(x) = 9.41656722E-001
sqrt(x) = 5.77321401E+000
```

Here is what happens when x is passed as a VAR parameter:

exp(x) = 1.00000000E+000

sin(x) = 3.66671177E-194
sqrt(x) = 1.91486599E-097

Here is what happens when x is passed as a VARS parameter:

```

sin(x) = 9.41656722E-001
sqrt(x) = 5.77321401E+000
```

Three of the four compilers give incorrect answers when a REAL8 variable is passed as a VAR parameter and used as an argument to a library function.

Pascal library functions. In BUG1, each function is invoked with and without extra parentheses. The functions are passed the same floating-point number as a parameter. In one set of function calls, the parameter is declared REAL4 (the normal 32-bit REAL in Pascal). In the other set of calls, the parameter is declared REAL8. REAL8 corresponds to the 64-bit IEEE format and provides more precision than REAL4.

Figure 1 shows the output from BUG1 after it was compiled with MS-Pascal 3.13 and linked with the 8087

Pascal Support

Microsoft (IBM)Pascal is an effective tool for serious application development. Powerful abstract data capabilities, block structure, modular compilation, and direct memory addressing produce code that runs fast, and is easy to maintain. The Blaise Computing Programmer Productivity Series makes this environment even more attractive and speeds completion of your systems. You can obtain these tools from us for a fraction of the cost of developing them yourself. Source code is either included or available with each package, so you can make modifications easily. No royalties are required for incorporating our routines into your systems.

Blaise Computing's Pascal products have been reviewed favorably many times during their two years on the market, and in a recent survey, our users report them to have been extraordinarily valuable.

◆ **Pascal TOOLS™** is a library of procedures including powerful string manipulation, screen and keyboard handling, and graphics primitives. There are also a command line parser, a general BIOS gate for easy use of all hardware services, and many other features. **\$125**

Develop your Applications Quickly

◆ **Pascal TOOLS 2™** gives access to the advanced operating system services of DOS 2.0 and later versions. Your Pascal program can retrieve DOS system information, perform full memory management, and execute other programs. There is a general gate to access all DOS services, and specific procedures are provided for handling files, directories, and disk I/O. **\$100**

◆ **VIEW MANAGER™** is our display screen management system that makes screen development and documentation much faster. A complete library of Pascal procedures implements block mode data entry and transmission. Information can be captured or recalled, and context-relevant help files displayed with simple procedure calls. **\$275**

◆ **ASYNCH MANAGER™** is a library of interrupt-driven routines providing a general interface to both COM ports for your asynchronous communications applications. Introductory price of **\$175** includes all source.

Will Your PC Handle a Volume Larger Than 32 MB?

280 MBytes in one volume

Emerald Systems has broken the 32 MByte DOS barrier and shattered popular attitudes about the performance of micro computers. Our disk drives will easily handle a single logical volume up to 280 MBytes in size (unformatted) on the IBM-PC, XT, AT* and compatibles. Speed? Emerald drives aren't just fast, they're *F_A_S_T*—no more trips to the coffee pot while files load.

Emerald delivers the "extras"

The extras means support of the most popular Local Area Networks, password access, support of the VENIX, XENIX, QNX, PC/IX and DOS 3.x operating systems, and user configured, main-frame style, disk caching. Plus, you're not limited to one volume—use up to 24, if you need them, even on one physical disk. You can even spread one volume across two drives. You can have up to 240 MBytes of formatted storage in-board your PC. Or, you can insert an Emerald sub-system, with integral backup and six PC expansion slots, right under your monitor, without increasing your PC's "footprint" even one inch.

Backup protection

Backup of large files is mandatory. Emerald can supply you with 1/4 inch, 60 MByte, cartridge or 1/2 inch, reel-to-reel, backup systems. The 1/2 inch system can even translate your mainframe (EBCDIC) files to ASCII.

When operated under Emerald's Backup and Restore Utility (BRU) software, both backup files automatically, allow streamer or file oriented operation and file by file access of data. And, they do it fast—our 1/4 inch tape drive operates at 5.4 MBytes per minute. That means you can backup 60 MBytes, on one cartridge, in 11 minutes.

Cost Effective

Emerald products translate directly into dollars and "sense." Why pay mainframe prices to do a job your PC can accomplish for a fraction of the cost?

Still not convinced?

Why don't you pick up the phone? Dial (619) 270-1994, and ask to speak with an applications engineer. You can find out about our large installed customer base, learn about some of the applications environments our systems are performing in, or just request literature. We'll even give you references in your area. Find out what your PC can do with a logical volume bigger than 32 MBytes.

emulator version of PASCAL.LIB. Notice that the test cases using REAL4 all give the correct answers. But when the parameter is of type REAL8 and extra parentheses surround the function, the results are dreadfully wrong.

This bug was fixed in MS-Pascal 3.2 and does not appear in either of the IBM versions of the compiler.

Bug 2: Assignment of REAL nested variables. MS-Pascal 3.2 gives the wrong answer if REAL variables are used in an assignment statement and the variables are declared in a procedure at a higher level of nesting than the procedure that contains the assignment statement. This sounds more complicated than it really is. An example will help explain it. In listing 2, the program BUG2 contains two procedures, INNER and OUTER. The two REAL variables x and y are declared in OUTER. The procedure INNER includes an assignment statement to assign the contents of y to x .

PAS2 of MS-Pascal 3.2 fails to generate the correct machine code for this assignment statement. Whereas x and y should both equal 77.77, x equals 9.758847000E-37, and y equals 7.777000000E+01. Fortunately, there is an easy way around this bug.

Listing 3 is a program to force the compiler to generate the correct code

FIGURE 3: Code Generated from Assignment Statement

```

1  MOV     AX,2710H      ; AX = 10000
2  MUL     W              ; MULTIPLY W * 10000
3  XOR     DX,DX          ; CLEAR THE HIGH WORD OF THE ANSWER
4  MOV     X,AX           ; LOW WORD OF X = LOW WORD OF MULT.
5  MOV     X+2,DX         ; HIGH WORD OF X = 0

```

The compilers generated this machine code for the assignment statement, $X := W * 10000$. (The line numbers and comments are the author's.) The compiler falsely zeroed out the high-order word by performing an exclusive OR on DX.

for the troubled assignment statement. The problem disappears if y is moved out to the program (or module) level, thereby making it static.

This bug does not exist in earlier versions of MS-Pascal or in either IBM version. Microsoft claims that it has fixed this bug in version 3.3.

Bug 3: REAL VAR parameters to library functions. When a REAL8 variable is passed to a procedure as a VAR parameter and then used as an argument for a REAL library function, all but one version of the compiler fall apart. Not surprisingly, the version of Pascal that holds together in this situation is also the oldest, IBM Pascal 1.0. This is because IBM 1.0 pre-dates support for double-precision floating-point (REAL8) numbers.

Listing 4 shows what happens when REAL8 variables are passed as VAR

parameters. Figure 2 gives the results. This problem can be bypassed by always declaring REAL8 parameters as VARS instead of VAR. VARS forces the compiler to pass the complete segmented address of the parameter to the procedure, whereas VAR lets the compiler pass only the 16-bit offset.

Bug 4: Multiplication results assigned to double-word INTEGER. Sometimes within Pascal, it is more convenient to use a WORD variable instead of an INTEGER variable to hold a number. If the number to be stored will never be negative, the obvious reason for using a WORD is that it can hold a value twice as large as an INTEGER. The largest number that can be stored in a WORD is 65,535, whereas the largest number that can be stored in an INTEGER is 32,767.

Another way to store larger numbers is with the data type INTEGER4. An INTEGER4 variable is four bytes (two words) long. The normal INTEGER and WORD types are only two bytes (one word) long. When WORD, INTEGER4, and multiplication were mixed in the same assignment statement, three out of the four Pascal compilers tested here generated incorrect machine code for the statement:

```
X := W * 10000;
```

where X is a variable of type INTEGER4 and W is of type WORD.

Figure 3 shows the code that the compilers generated for this assignment statement (the line numbers and comments shown here are mine).

When the 8088 executes a multiply instruction, such as the one on line 2 in the generated code example, the results are returned in the DX and AX registers. DX contains the high-order word of the answer, and AX contains the low-order word. In this example, the compiler falsely zeroed out the high-order word by performing an exclusive OR on DX (line 3). Because of this compiler mistake, the high-order word of the variable X is incorrectly set to 0.

Listing 5 contains a short program, BUG4.PAS, to demonstrate this problem. With w equal to 9 and i equal to 9,

PASCAL BUGS

when multiplied by 10,000, both answers should be 90,000. Although $i * 10,000$ gives the correct answer, $w * 10,000$ becomes 24,464.

Bug 5: Pascal programs work on PC and XT but fail on AT. When run on a PC/AT, my Pascal programs, which worked on the PC and PC/XT, consistently gave wrong floating-point answers. As a long shot, I tried linking my Microsoft Pascal 3.2 programs with the IBM 2.0 version of PASCAL.LIB. Suddenly, the programs seemed to work.

The IBM Pascal 2.0 compiler is a derivative of MS-Pascal 3.2. Before IBM released version 2.0, it must have tested the compiler on prototype ATs, discovered some compatibility problems, and then fixed them.

MS-Pascal uses an Intel-documented technique for automatically detecting the presence or absence of a math coprocessor. The technique works just fine on PCs or XTs for accurately detecting the 80287. Unfortunately, when that technique is used on the AT, an 80287 is always detected, whether or not it is actually present.

Based on the answer from the coprocessor-detection-test, Microsoft Pascal either generates floating-point instructions or emulates them. On the AT, MS-Pascal always thinks that an 80287 coprocessor is present to do floating-point operations. If no 80287 is installed, as was the case with my testing, the compiler generates 80287 instructions anyway. The floating-point instruc-

tions then end up executing on an empty chip socket, and, therefore, the answers that are returned are always 0.

Microsoft has fixed this bug in the upcoming 3.3 release of the compiler. In the meantime, software developers and end-users alike should be aware of this problem; the failure of a program to operate properly on an AT may or may not be obvious and, of course, could be devastating to a data file.

PC Tech Journal soon will publish code that determines in which members of the PC family the program is executing and establishes the presence or absence of the coprocessor. 

Ted Forgeron is vice-president of systems software engineering at Multisoft Corporation located in Beaverton, Oregon.

mbp COBOL for your IBM/PC

Now, more convenient... 4 (exclusive) ways.

Now, the mbp COBOL Compiler offers unrivaled convenience to go with its unmatched performance.

Here are the convenience features you've wished for:

1) an enhanced Screen Management System with program-controlled video attributes and color; 2) support for PATH & sub-directories; 3) DOS command execution from within a COBOL program; 4) 'permanent' DEFAULT modification.

The new mbp Compiler has them all! And they're exclusives: you get them *only* with mbp.

Plus, it's 4 times faster.

Because the mbp COBOL Compiler generates native machine language object code, it executes programs *at least* 4 times faster (see chart). Now, we've made that performance even more convenient to use.

The complete COBOL.

An Interactive Symbolic Debug Package included standard; Multi-keyed ISAM structure; SORT & CHAIN; GSA certification to ANSI '74 Level II; IBM/PC-AT and TI Professional compatibility; with mbp, you get it all. Optional: Novell NetWare interface.

mbp COBOL: the choice of professionals.

It's no surprise more and more companies like Bechtel, Bank of America, Chase, Citicorp, Connecticut Mutual, Hughes Aircraft, McDonnell-Douglass, and Price-Waterhouse choose mbp COBOL.

Make it your choice, too.

The Powers that Be

Many Pascals offer no facilities to handle powers of numbers; here are two functions that do.

How would a user handle powers of numbers in Pascal? In FORTRAN or BASIC he would write $X^{**}Y$ or X^Y to accomplish a surprisingly complicated task, but many Pascals do not offer such a facility beyond $SQR(X)$, which squares X , or $SQRT(X)$, which finds the square root of X . (Noteworthy exceptions are Microsoft and IBM Pascals, which do include such a function).

Two functions are provided here that calculate the value of X^Y , where X is real and Y may be either real or integer. Listing 1, $PWRR(X,Y)$, is a function that provides answers for the real case and listing 2, $PWRI(X,N)$, is the corresponding function for integer exponents. No function is provided specifically for integers to an integer power, although one certainly could be written. In that case, it would be necessary to decide what is meant by, for example, 2^{-2} . Either of the functions provided here would yield 0.25, but if integer arithmetic is desired, the result should be 0. Obviously, $PWRI$ can be used with the understanding that all results less than 1 in absolute value are taken to be 0. The reader is challenged to write a suitable algorithm for this case using the ideas presented here.

If Y is type real, then the formula $PWRR := EXP(Y*LN(X))$ must be used; this formula will fail, however, under

certain conditions. If $X < 0$, $LN(X)$ is a complex number, and Pascal does not support type complex. $LN(0)$ is undefined, so the cases of 0^Y must be handled separately. First of all, 0^0 is undefined, so that one is ruled out. If $Y > 0$, then $0^Y = 0$ for all such Y . Last, but not least, is the case where $X = 0$, $Y < 0$. Because $X^{-Y} = 1/(X^Y)$, this case leads to division by zero, a circumstance that the computer (not to mention mathematicians) resents.

The function $PWRR(X,Y)$ is shown in listing 1. Note that the tests of the values of X and Y in the function correspond to the remarks above. The function was tested in Turbo Pascal.

If Y is type integer the computation can be speeded up. The computations of LN and EXP are relatively slow because they involve the calculation of truncated infinite series in which the coefficients have been slightly fudged to compensate for the truncation.

Instead, an ancient Arabian algorithm, closely related to "Russian peasant multiplication," and known to the western world only since the Renaissance, is invoked. In this algorithm, the binary representation of the exponent is scanned from right to left to produce a pattern of squaring and multiplication operations that provides a near-optimum computation time (listing 2). For

example, X^5 is computed as $(X*X)^2*X$ with only three multiplications, but the computation $X^5 = X*X*X*X*X$ requires four operations. The algorithm does not save a lot of time for small exponents, say for those that are less than ten, but it does speed execution for computations with large exponents.

Again, there are restrictions on X and N for $PWRI(X,N)$. In this case, $X < 0$ with $N > 0$ is permitted, but 0^0 is still undefined. $X = 0$ with $N < 0$ implies division by zero and must be excluded, as before, and $X = 0$ with $N > 0$ yields 0. If $X > 0$ and $N < 0$, the bit-search algorithm must be applied to $ABS(N)$ and a reciprocation must be done at the end. $PWRI(X,N)$ is also written in Turbo Pascal, as shown in listing 2. In neither function is there any protection against overflow. An attempt to calculate 1000^{1000} will yield whatever runtime error messages a given Pascal system provides. Otherwise, the functions are as foolproof as possible. Listings 3 and 4 are driver programs that test the functions $PWRR(X,Y)$ and $PWRI(X,N)$.

Paul F. Hultquist is a professor of electrical engineering and computer science at the University of Colorado at Denver. He has a Ph.D. in physics and has been teaching in the computer field for almost 30 years.

For CPM80 2.2/3.0 (Z80 required/64K) • 8" SSSD, Kaypro 2/4, Osborne I SD/DD, Apple II, & others

Great For All Languages

A general purpose text processor, the MIX Editor is packed with features that make it useful with any language. It has auto indent for structured languages like Pascal or C. It has automatic line numbering for BASIC (255 character lines). It even has fill and justify for English.

Terminal Configuration

A utility for defining terminal features (smart features included) allows the editor to work with any terminal. Over 30 of the most popular terminals are built-in.

Custom Key Layouts

Commands are mapped to keys just like WordStar. If you don't like the WordStar layout, simply change it. Any key can be mapped to any command. You can also define a key to generate a string of characters, great for entering keywords.

Split Screen

You can split the screen horizontally or vertically and edit two files simultaneously.

Macro Commands

The MIX Editor allows a sequence of commands to be executed with a single keystroke. You can define a complete editing operation and perform it at the touch of a key.

Custom Setup Files

Custom keyboard layouts and macro commands can be saved in setup files. You can create a different setup file for each language you use. The editor automatically configures itself using a setup file.

Command Mode

Command mode allows any editor command to be executed by name. It is much easier to remember a command name versus a complicated key sequence. Command mode makes it easy to master the full capability of the editor. Frequently used commands can be mapped to keys. Infrequent commands can be executed by name.

Editor Commands

The editor contains more than 100 commands. With so many commands, you might think it would be difficult to use. Not so, it is actually extremely simple to use. With command mode, the power is there if you need it, but it doesn't get in your way if you don't. Following is a list of some of the commands.

**It's easy to make a copy.

It's illegal.
It's wrong.**

It's hard to believe.

People who wouldn't think of shoplifting a software product on their lunch hour don't think twice about going back to the office and making several illegal copies of the same software.

Making unauthorized copies of software is a violation of U.S. Copyright Law. Yet, the problem has reached epidemic proportions because many people are unaware, or simply choose to ignore the law. The software industry is urging decision-makers and software users to take steps to stop software piracy in their organizations. In the meantime, the industry has been forced to prosecute willful copyright violators.

There are legal, moral and economic imperatives forbidding theft of copyrighted software.

There is a free pamphlet on the subject. Call or write for a copy. A copy. A copy. A copy for everyone you know. Please ask for Priscilla.

User-friendly or Foe?

In attempting to be user-friendly, this book discusses the range of end-user issues, but sometimes too lightly.

Design of User-Friendly Programs for Small Computers

Henry Simpson (McGraw-Hill Book Company, New York, NY, 1985) 230 pages; paper, \$18.95

Every programmer wants to design software that is user-friendly. But that desire and a finished product that fits the bill are often separated by a chasm—the ability to accomplish the feat in the face of

little or no information on just what makes a program easy to use.

Oh sure, there are a lot of books on human factors that can help. (Human factors are characteristics of people that influence their ability to perform.) But these books are usually scholarly in tone (read “hard to understand”), and their conclusions seldom apply directly to program design.

With *Design of User-Friendly Programs for Small Computers*, Henry Simpson has taken the question of human factors to the designers of computer programs. And although this book does not discuss many of its subjects very fully, it does offer useful tips on a wide range of design issues.

The first chapter introduces some concepts important in the design of easy-to-use programs. It stresses the programmer's attitude as one of the most significant factors. By keeping the user constantly in mind, the programmer is more likely to include many human-engineered features instead of, as often is the case, adding them as an afterthought.

Chapter 2 looks at the human operator and describes the inherent characteristics that should influence the design of programs. It shows how the

effective use of sound (such as beeping when an error occurs) and visual properties (such as color, brightness, and flashing characters) can improve an individual's ability to use a program. It discusses memory and the general inability of people to remember too much for too long.

This chapter also divides users into several classifications and points out that different types of users have different types of needs. For example, first-time users might require menus and help information to guide them through the program. But once those users become familiar with program operation, they probably will wish for a faster way. By defining the program's audience before writing it, and designing the program to adapt to the different kinds of persons in that audience, a programmer may be able to improve the usability of the software he creates.

Chapter 3 offers 12 principles for programmers to consider when designing programs. Most are obvious, such as keeping the program simple, being consistent, and giving adequate feedback. Nevertheless, many existing programs do not adhere to all of the principles outlined here and might have benefited from having done so. (How many times has a user wondered whether a program he is using has crashed or is simply taking its sweet time? A helpful “Please wait” message could relieve a little of that tension.)

Chapter 4 discusses the program development process. Here the author notes that most programs are designed either top-down (defining general modules first, and breaking each into more and more detail) or bottom-up (designing specific functions and combining them to provide more general operations). Both of these design methods are inside-out—that is, they concentrate on the inside of the program first and the operator interface second. This chapter outlines steps that the program-

mer can take to make program development an outside-in process.

To some extent, chapter 5 is about design considerations based on different kinds of hardware, such as monitors, printers, and input devices. Unfortunately, this chapter is concerned not so much about designing software, but more about choosing the proper hardware for a given situation. When the chapter does touch upon design issues (such as when light pens, mice, and trackballs are especially useful), it skims over them very briefly.

Chapter 6 describes program output. It gives advice on screen layout, the use of language, tabular versus graphic presentation, color and brightness coding, and more. It offers good advice on designing useful screens and reports.

Similarly sound advice is offered in chapter 7, which deals with data input. The author stresses that programs should be adjustable so that the operator can control when and where data are entered. And the chapter warns against giving programs insulting, patronizing, or even human personalities. Also discussed are methods that should be used in programs to request and validate information from users.

Program utilities, such as system set-up, file creation, and database editing, are the subjects of chapter 8. The need for such utilities is explained, and, in addition, some relative guidelines and flowcharts are included.

Chapter 9 covers program control: the way the operator interacts with a program. The author discusses computer-initiated dialogue (such as asking specific questions or displaying menus) and operator-initiated dialogue (the blinking cursor at which the operator can enter any command).

The last two chapters are about documentation and testing. Chapter 10 provides suggestions for writing two different kinds of documentation: system (or internal) and end-user. Chapter

BOOK REVIEWS

11 describes the different types of testing that should take place before a program is considered finished.

Although this book contains many interesting tidbits, none of its information is very new or startling. Anyone who has ever worked on a major piece of consumer software will already know everything this book has to offer. It also has an annoying tendency to offer statements without providing enough information to back them up. For example, chapter 5 recommends against using color unless it is really needed. This is followed by a list of instances in which color could improve the usability of a program. But the author never gets around to explaining why one should not use color just to brighten up an otherwise dreary graphics screen.

This tendency to leave out the reasons behind the recommendations could be the result of the author's desire to avoid the pitfalls of complex, human factors textbooks. However, by bending over backward to be simple, the book misses a chance to help its readers by providing more details.

Nor does the book include any programming examples. Programmers who are expecting detailed instructions on how to create pop-up menus of situation-specific help screens will be disappointed. This lack of programming examples tends to make some of the chapters (notably the chapter on utilities) mere hand-waving exercises.

A final complaint: the book tends to wander from the main point occasionally. Although the chapters on hardware, documentation, and testing provide some useful information, not much of it applies to designing programs. Still, for programmers who are relatively new at designing end-user software, this book can be worthwhile. It offers many design tips that might otherwise take months or years to discover. And the chapters on input and output may help even a veteran programmer to design better screens.

THE BALANCING ACT OF 1985.

You didn't buy an
IBM PC-AT just to
balance your checkbook.
You bought it to crunch
lots of numbers and
words, in the shortest
possible time. A labor
saver. A time saver.
Hence, a money saver.

So, do your part for effective
money management;
hard disk storage is no
place to be penny-wise and
pound foolish.

TELL 'EM YOU NEED HIGH SPEED AND DATA PROTECTION.

These and other
important features do add
cost, but that makes a
premium drive.

Anything that can be
made, can be made
cheaper, sell for less, offer
lower performance, and
probably die young.

Remember, usually
you get what you pay for,
and you ALWAYS get
what you don't.

ALL HARD DISKS ARE NOT CREATED EQUAL.

There are vast differences
in the speed and reliability
of Winchester hard disks.
Since the IBM PC-AT is an
incredibly fast machine, a
slow drive can make an AT
run like an XT.

So, before you get stuck
with a slow drive in your
AT, save your boss two
grand and buy an XT.

Or better yet, buy the AT
and avoid any drive with
Access Times over 40 milli-
seconds.

RELIABILITY: WHERE HAS ALL THE DATA GONE?

Now tell 'em the drive
must have a data protec-
tion scheme. One that's
easy to use and reliable.

Winchester heads read
and write while "flying" a
few microns above the
data surface. If the heads
contact the recording
media, you risk a head
crash, and significant or
total data loss.

So, even a fast drive
without data protection is
virtually worthless. Frank-
ly, we'd rather sleep at
night.

BEWARE OF USER-DEPENDENT PROTECTION SCHEMES.

Some drives have a
safe landing zone for the
heads, but you need to call
a separate program to
send 'em there. If you
don't call that program,
and most folks won't, the
heads in these drives
ALWAYS land on data
when powered down.

The slightest bump or
vibration can move the
heads, wiping out those
data tracks. And the R/W
heads can become
contaminated, thus
increasing the error rate,
slowing down average ac-
cess until the whole drive
fails.

Consequently, those
drives offer a very high
risk of head crashes, a
false sense of security, and
little else.

What's your data
worth? \$200? \$400?
Specify AUTOMATIC
data protection. ATplus
has it. And it doesn't cost,
it pays.

PEACE OF MIND.

Specify AUTOMATIC

This system provides
unparalleled head crash

Since this is 100%

cance.

We believe that
computers ought to serve
people, not the other way
around.

BEWARE OF THE BARGAIN BAND-SCHLEPPER.

Avoid drives with in-
expensive Band-Stepper
positioner technology.
These were pretty good
way back in 1980, con-
sidering that's all anyone
had. But by today's stand-
ards, they're inaccurate
and very mechanical.

They waste time look-
ing for the right track to

worth no where near the
price you'll pay for 'em -in
more ways than one.

THE HIGH TECH SOLUTION.

R&D Tax Incentives

The tax code offers incentives to companies wanting to step up their research and development efforts.

How do you react when you hear the phrase, "I'm from the government, and I'm here to help you?"

Right. Okay, loosen your grip on your wallet—this is only a rhetorical question. The government really does want to help companies willing to increase their research and development efforts and, if these companies act quickly, they may be able to take advantage of provisions of the tax code that will save money, let them show their customers how to reduce the after-tax cost of the company's services, and show investors how the government can help underwrite part of the risk of their investment. The magic provisions to which I refer are Internal Revenue Code Sections 174 and 30.

Section 174 of the code provides that "research or experimental expenditures" incurred in connection with a trade or business are deductible and need not be amortized over the useful life of the resulting technology.

In 1981, Congress decided that not enough money was being spent by the private sector on research and development. To spur such activities, Congress included in the Economic Recovery Tax Act of 1981, a provision creating a Research and Development Tax Credit (now known as Internal Revenue Code Section 30). The only problem with this tax credit is that time is running out; Section 30 is scheduled to expire December 31, 1985.

Under Section 30, a taxpayer is entitled to a credit (a dollar for dollar reduction of tax) equal to 25 percent of the amount by which *qualified research expenses* for the year exceed *base period research expenses*. A whole volume of information is concealed in that simple statement, and the purpose of this article is only to alert the reader to the possibility that the federal government may in fact be in a position to help. The extent of that help can be determined only on an individual basis, which is

why there are accountants and spreadsheet programs.

To determine whether a company can benefit, it is necessary to compute base period research expenses. For 1985, they are the greater of: (1) the average of "qualified research expenses" for the preceding three tax years; or (2) one-half of the qualified research expenses for the current year.

Qualified research expenses include costs that are incurred in a trade or business, either in-house or by contract with another party, for developing or improving an experimental or pilot product, invention, or similar product. The expenses must be generated by a project that is of an experimental nature—minor improvements to an existing product about which there is no doubt of feasibility do not qualify. The Internal Revenue Service defines *research or experimental expenditures* in the following way:

"The term . . . means expenditures incurred in connection with the taxpayer's trade or business which represent research and development costs in the experimental or laboratory sense. The term includes generally all such costs incident to the development of an experimental or pilot model, a plant process, a product, a formula, an invention, or similar property, and the improvement of already existing property of the type mentioned. The term does not include expenditures such as those for the ordinary testing or inspection of materials or products for quality control or those for efficiency surveys, management studies, consumer surveys, advertising, or promotions. However, the term includes the costs of obtaining a patent, such as attorneys' fees expended in making and perfecting a patent application. On the other hand, the term does not include the costs of acquiring another's patent, model, production or process. . . ."

Separate rules apply to the calculation of qualifying expenses, depending

on whether the expenses are incurred in-house or are paid to another company (referred to in the Code as *contract research expenses*). In-house qualified expenses include the costs of wages, supplies, and equipment rentals necessary for the qualified project; contract research expenses qualify to the extent of 65 percent of amounts paid to a third party for qualified research.

Expenses to develop a product that is intended to be transferred in exchange for royalties cannot be counted as qualified research expenses for the developer; however they could qualify for the purchaser.

Having computed base year qualified expenses, the process is repeated for the current year (except that 65 percent of contract research expenses is included). Then subtract the base year qualified expenses, take 25 percent of the difference, and that is the amount of tax savings attributable to R&D (subject, of course, to the normal limitations on tax preference items).

BENEFITS FOR CONSULTANTS

If a company is engaged in its own qualified research and development, the benefits are obvious. However, the R&D tax provisions can also provide benefits to other companies in less obvious ways. Two examples are the private consulting business, and the financial backers of R&D ventures.

A private consultant (or other contractor) can benefit by structuring his services so that his client can get the benefit of the contract expenditures R&D credit. For example, if the client had no previous qualifying expenses, then it is entitled to a benefit of $(25\% * 65\%) - (0.5 * 25\% * 65\%)$, or 8.125 percent of the amount that is paid to its consultant for qualifying research and development. In other words, the government will give the consultant's client an 8-percent rebate—not a bad sales tool to have at hand.

If the type of research requires substantial overhead or capital expenses, a consultant may be able to structure the transaction so that a client will save money by contracting for the work rather than doing it in-house. Remember that in-house expenditures are limited to wages, supplies, and equipment rental; they do not include overhead or the purchase price of equipment. On the other hand, the credit for contract services is based on the contract price (regardless of the compo-

nents of that price, provided that the contract is for qualified expenses), but qualifies only to the extent of 65 percent of the price. Therefore, in the simple case in which the client can take full advantage of any available tax credits, and in which the client has no base year qualifying expenses, it will be cheaper to contract for the work in situations where:

In-house Cost - $(12.5\% * (\text{wages} + \text{supplies} + \text{equipment rent})) > \text{Contract Price} * 91.875\%$

The contractor might even convince the client that a "best-efforts" contract would be advantageous (where the contractor is obligated to use his best efforts, but is not obligated to achieve any particular result), since that would strengthen the position that the project was indeed development "in the experimental or laboratory sense."

HIGH-TECH INCENTIVE

The tax code can also be used to provide an incentive to investors in high-tech ventures. The structure of such financing is complicated, but the basic pattern is quite simple. If investors were to invest directly in a high-tech corporation, they would receive immediate tax benefit. The result would be different, however, if the technical specialists form Company A, the investors form Company B (usually in a limited partnership), and then Company B contracts with Company A to develop the new technology. Internal Revenue Code Section 174 makes the research expenditures currently deductible and, under the proper structure, this deduction can benefit the investors individually.

Under some circumstances, the tax credit also may be of benefit to the investors, although this will depend in part on whether the research is deemed to be incurred "in carrying on" a trade or business (a phrase that has a technical meaning in tax law). Whether the tax credit is available or not, the deduction provides investors with an immediate tax benefit that reduces the net risk of their investment. Typically, the technical specialists reserve an option to acquire a license to use any resulting technology for a royalty that will give the investors a satisfactory return on their investment. The technical specialists may take an additional option to acquire the technology itself after the holding period necessary to qualify for long-term capital gains treatment passes.

With proper planning everyone benefits: the technical specialists can improve their competitive position or reduce the cost of (and increase the likelihood of obtaining) financing; consumers of high-tech services can lower their net costs; investors can receive tax benefits that reduce their risk and increase their profit potential; and Congress can achieve the increased private sector research efforts that it deemed necessary a few years ago.

101 Hands-on Micro Software Evaluations. Yours for just \$19 each!

The only way to really see what a software package can do is to try it out. But software evaluations take time—and money. And even then you can't be sure you didn't overlook something big.

That's why thousands of corporate micro software buyers are turning to Data Decisions for accurate, up-to-the-minute information and independent hands-on analysis.

Data Decisions gives you the results of tests done under *consistent, controlled conditions* by a specially trained team of micro experts who

tell you what each product's strengths and limitations are and how suitable it is for corporate use. They also give you all the pricing and specs.

“Just one report saved me three nights of tinkering at a computer store on my own time. It's like having a consultant sitting right there at the end of the desk.”

—Bob Butler, Mechanical Engineer
Gillette Company, Boston, MA

Until recently these evaluations

were available only to subscribers to MICROCOMPUTERS, Data Decisions' 3-volume monthly updated information service. Now you can receive some of the same reports our subscribers get for only \$19 each, just by filling out and returning the order form below. MTBASIC

Features:

- | | |
|--------------------|------------------|
| Multitasking | Windowing |
| Handles interrupts | Interactive |
| Fast native code | Compiles quickly |
| Floating point | No runtime fee |

MTBASIC is a true native code compiler. It runs Byte's Sept. '81 sieve in 26 seconds; interpreters take over 1400 seconds! Because MTBASIC is multitasking, it can run up to 10 Basic routines at the same time, while displaying ten separate windows. Pop-up/down menus are a snap to implement.

The MTBASIC package includes all the necessary software to run in interpreter or compiler mode, an installation program (so any system can use windowing), three demonstration programs and a comprehensive manual.

AVAILABLE for CP/M (Z-80), MS-DOS, and PC-DOS systems.

What every IBM PC user should ask before buying the "Sider" 10 MB hard disk:

When a company offers a superior quality 10 megabyte Winchester hard disk for only \$795, it's bound to raise a few eyebrows...and a lot of questions. The fact is, you're probably already wondering "Can I really get a 10 megabyte hard disk that's *reliable* for only \$795?" The answer is: ABSOLUTELY...when you choose the Sider from First Class Peripherals.

What's so great about the Sider?

For starters, the Sider lets you boot your **IBM PC*** or **PC/XT** directly off the hard disk—unlike some other Winchester subsystems. Rebooting is also trouble-free. And the disk is partitionable, giving you a convenient way to organize your data, as well as access the information you store.

What's more, a small "footprint" lets you incorporate the compact Sider into your existing computer set-up with ease.

In addition, with the Sider, you not only pay far less for the subsystem, you also save money on installation. Because, unlike other 10 MB systems that require the purchase of expensive "extras," the Sider is *plug and play*. Everything you need is provided, including cables, host adaptor, installation software and manual.

What makes it so reliable?

To start, the Sider is manufactured, and sold exclusively, by First Class Peripherals, an innovative computer company which is backed by Xebec. The computer industry's leading manufacturer of disk controllers, Xebec has over a decade of experience serving customers like IBM, Toshiba, Texas Instruments and Hewlett Packard. It's this kind of expertise that helps assure the Sider's performance.

Special design features further enhance reliability. The Sider's controller is the field-proven, industry standard Xebec SI410A. And Xebec's 3200 drive tester, the toughest in the industry, ensures error-free media to keep the Sider operating reliably,

* Must contain hard disk ROM.

"Only \$795?"

longer. A self-contained power supply also adds to dependability by eliminating the risk of heat build-up that could cut PC component life. One more assurance of the \$795 Sider's quality: it's UL Approved and FCC Class B rated.

But why is it only \$795?

You pay less for the Sider than for other 10 MB hard disks simply because you're paying for the superior quality components inside the unit, not for a lot of retail overhead costs. Since First Class Peripherals sells direct, you avoid dealer and dis-

tribution expenses, and pay only for the product.

What about a guarantee?

Like many experienced PC users, you may be reluctant to buy a hard disk priced at only \$795 without first seeing for yourself how it performs. That's why First Class Peripherals offers you a reassuring, money-back guarantee that eliminates any risk on your part. Simply order the Sider and use it for 15 days. Then, if you're not entirely satisfied, return it and receive a full refund—no questions asked.

The Sider also comes with a full one-year limited warranty. Plus, there's a convenient, toll-free hotline you can call anytime you have a technical or service question, or need help.

Don't delay.

Order the Sider now.

To receive the Sider 10 megabyte Winchester hard disk subsystem for only \$795, simply order using the coupon below. For faster service, order by phone and charge to your VISA, MasterCard or American Express. (You can also call us if you have any questions or technical concerns about the Sider. We'll see you get the help you need.) Call toll-free:

MICROTEC RESEARCH's extensive
line of field-proven software
development tools for serious
software developers.

Manufacturer Compatible

MICROTEC RESEARCH has been
providing flexible and economical
solutions for software developers since
1974. We've grown with the industry as
our cross software development tools
have transformed many large and small
computers into powerful cross develop-
ment systems for microprocessor applica-
tions. Our software tools are manufacturer
compatible. Therefore, software made
using manufacturers development
systems may be more productively used
in the MICROTEC RESEARCH cross-
development environment.

Effective Differences

Beginning with product concept, through
development, quality assurance, and
post-sales support — **Quality, Compati-

which set MICROTEC RESEARCH apart
from the others.

Fully-Supported

MICROTEC RESEARCH's products are
continually maintained and updated
based upon the experience of thousands
of installations worldwide. Revisions and
modifications are distributed to licensees
in warranty or covered by a service
contract. Upgrades, which are major
enhancements to a product's capabilities,
are available at a significant discount. Our
update/upgrade policy assures users
they'll always be current with the fast

TeamMate's Storage Solution: Two Minute Backup and Versatility

Two
minutes
to back
up data?

It's true with TeamMate's family of storage subsystems featuring the remarkable Kodak™ 2.78 megabyte flexible drive and free Backup™ software.

Frankly, most people know they need to protect their valuable data by backing up files regularly. They don't because it takes too long.

TeamMate has taken care of that.

All you do is back up your full hard disk once. 10 megabytes can be copied in about 20 minutes onto 3 or 4 Kodak high capacity diskettes.

Then TeamMate's easy-to-use Backup software allows you to automatically back up your modified files in as little as 2 minutes!

New advances in backup are just part of the TeamMate/Kodak success story.

TeamMate's Winchester and Kodak 2.78MB flexible drive subsystems also add unprecedented flexibility and versatility to the IBM™ PC, AT, or compatible computers.

Kodak Drives...
Unlimited Storage at a
Low Cost

Install them internally or externally. Either way, TeamMate's family of Kodak 2.78MB flexible drives give you Winchester-like capacity, plus the convenient familiarity of a floppy. You get eight times the online storage capacity of a standard floppy... and unlimited expandability.

The Kodak 2.78MB drive guarantees media interchangeability from drive to drive, and it can also read standard IBM PC and AT diskettes—ideal for

transporting your AT's data to standard PC's.

Need to achieve high capacity storage and rugged portability? Use our TeamMate 1103 (single Kodak drive) or the 1104, a Kodak drive and standard floppy combination—perfect for upgrading the XT. Or, use our external models featuring one or two Kodak drives to backup several PC's.

Winchester/Kodak Combinations...More Versatility

TeamMate's combined Winchester and Kodak subsystems deliver the greatest versatility available today. Use the high speed Winchester, and back up your data with the Kodak flexible drive. Also use the Kodak for data security, diskette savings, or data archiving.

Installation takes only minutes...and there's no need for software drivers or patches.

The TeamMate 1123 installs internally and adds 20 megabytes of hard disk storage plus the Kodak flexible drive. External Winchester/Kodak combinations turn a minimum PC into a sophisticated supersystem.

Save...With TeamMate Winchester Subsystems

High performance and a variety of capacities. That's TeamMate's family of Winchester subsystems.

Add 10 or 20 megabytes of storage to your system either internally or externally. For really big jobs, look to TeamMate's 1132...32 megabytes of formatted add-in storage.

Enhance a basic IBM PC AT configuration with 20 or 32 megabytes of reliable Winchester storage. TeamMate 1120 AT & 1132 AT attach directly to the AT's existing controller. Complete with drive, cable, mounting slides, and Backup software, they're ready to go in just minutes.

Adding a TeamMate to your system is the cost-effective way to handle a variety of tasks.

Call TeamMate today for
more information.

Be sure to ask us
about our
Apple family.

Only TeamMate's Kodak Drive Solves All Your System Needs

✓ Hard Disk Backup	High speed full or selective file backup onto high capacity diskettes. 10MB hard disk needs only 4 Kodak diskettes.
✓ Primary Storage	2.78 megabytes of online random access storage
✓ Portability	Floppy ruggedness...ideal for portable computers
✓ Expandability	Unlimited storage capacity—just change diskettes
✓ Data Security	Removeability gives you ultimate data security without security software
✓ Interchangeability	Media interchangeability guaranteed from drive to drive
✓ Read Standard Diskettes	Reads standard diskettes so you can exchange data between IBM PCs and ATs
✓ Diskette Savings	One Kodak 2.78MB diskette replaces 8 standard IBM floppies.
✓ Convenience	Install in minutes using standard DOS software
